## Avr Libc User Manual:

*Introduction to Embedded Systems* David Russell, 2022-05-31 Many electrical and computer engineering projects involve some kind of embedded system in which a microcontroller sits at the center as the primary source of control. The recently developed Arduino development platform includes an inexpensive hardware development board hosting an eight bit ATMEL ATmega family processor and a Java based software development environment. These features allow an embedded systems beginner the ability to focus their attention on learning how to write embedded software instead of wasting time overcoming the engineering CAD tools learning curve. The goal of this text is to introduce fundamental methods for creating embedded software in general with a focus on ANSI C. The Arduino development platform provides a great means for accomplishing this task. As such this work presents embedded software development using 100% ANSI C for the Arduino's ATmega328P processor. We deviate from using the Arduino specific Wiring libraries in an attempt to provide the most general embedded methods. In this way the reader will acquire essential knowledge necessary for work on future projects involving other processors. Particular attention is paid to the notorious issue of using C pointers in order to gain direct access to microprocessor registers which ultimately allow control over all peripheral interfacing.
