

# Cloudy with a Chance of Acid

Exploring the Creation and Effects of Acid Rain

## Purpose

The purpose of this experiment was to determine the effect of acid rain on the growth of plants. The hypothesis was that plants exposed to acid rain would show signs of stress and reduced growth compared to plants in a control group.

## Hypothesis

It was hypothesized that plants treated with acid rain would exhibit stunted growth, yellowing of leaves, and increased mortality compared to the control group over a period of six weeks.

## Materials

The materials used in this experiment included: 10 identical potted plants, distilled water, vinegar (to create acid rain), a spray bottle, a measuring cup, and a data collection sheet.

## Procedures & Data

The procedure involved dividing the plants into two groups. The control group received distilled water, while the experimental group received a simulated acid rain solution. Measurements of plant height and leaf color were taken weekly.

Over the six-week period, the control group showed a steady increase in height, while the experimental group's growth was significantly slower and less consistent.
