Invasions by exotic grasses particularly annuals rank among the most extensive and intensive ways that humans are contributing to the transformation of the earth's surface The problem is particularly notable with a suite of exotic grasses in the *Bromus* genus in the arid and semiarid regions that dominate the western United States which extend from the dry basins near the Sierra and Cascade Ranges across the Intermountain Region and Rockies to about 105 longitude This genus includes approximately 150 species that have a wide range of invasive and non invasive tendencies in their home ranges and in North America *Bromus* species that became invasive upon introduction to North America in the late 1800's such as *Bromus tectorum* and *B. rubens* have since became the dominant cover on millions of hectares Here millenia of ecosystem development led to landscapes that would otherwise be dominated by perennial shrubs herbs and biotic soil crusts that were able to persist in spite of variable and scarce precipitation This native ecosystem resilience is increasingly coveted by land owners and managers as more hectares lose their resistance to *Bromus* grasses and similar exotics and as climate land use and disturbance regime changes are also superimposed Managers are increasingly challenged to glean basic services from these ecosystems as they become invaded Exotic annual grasses reduce wildlife and livestock carrying capacity and increase the frequency and extent of wildfires and associated soil erosion This book uses a unique ecoregional and multidisciplinary approach to evaluate the invasiveness impacts and management of the large *Bromus* genus Students researchers and practitioners interested in *Bromus* specifically and invasive exotics in general will benefit from the depth of knowledge summarized in the book Florida Municipal Record ,1928 *The Florida Municipal Record* ,1928
