Multithreaded Computer Architecture: A Summary of the State of the ART Robert A. Iannucci, Guang R.

Gao, Robert H. Halstead Jr., Burton Smith, 2012-12-06 Multithreaded computer architecture has emerged as one of the most promising and exciting avenues for the exploitation of parallelism This new field represents the confluence of several independent research directions which have united over a common set of issues and techniques Multithreading draws on recent advances in dataflow RISC compiling for fine grained parallel execution and dynamic resource management It offers the hope of dramatic performance increases through parallel execution for a broad spectrum of significant applications based on extensions to traditional approaches Multithreaded Computer Architecture is divided into four parts reflecting four major perspectives on the topic Part I provides the reader with basic background information definitions and surveys of work which have in one way or another been pivotal in defining and shaping multithreading as an architectural discipline Part II examines key elements of multithreading highlighting the fundamental nature of latency and synchronization This section presents clever techniques for hiding latency and supporting large synchronization name spaces Part III looks at three major multithreaded systems considering issues of machine organization and compilation strategy Part IV concludes the volume with an analysis of multithreaded architectures showcasing methodologies and actual measurements Multithreaded Computer Architecture A Summary of the State of the Art is an excellent reference source and may be used as a text for advanced courses on the subject *Hypercube Multiprocessors*, 1987 Michael T. High-Level Synthesis for Real-Time Digital Signal Processing Jan Vanhoof, Karl Van Rompaey, Ivo Bolsens, Gert Goossens, Hugo De Man, 2012-12-06 High Level Synthesis for Real Time Digital Signal Processing is a comprehensive reference work for researchers and practicing ASIC design engineers It focuses on methods for compiling complex low to medium throughput DSP system and on the implementation of these methods in the CATHEDRAL II compiler The emergence of independent silicon foundries the reduced price of silicon real estate and the shortened processing turn around time bring silicon technology within reach of system houses Even for low volumes digital systems on application specific integrated circuits ASICs are becoming an economically meaningful alternative for traditional boards with analogue and digital commodity chips ASICs cover the application region where inefficiencies inherent to general purpose components cannot be tolerated However full custom handcrafted ASIC design is often not affordable in this competitive market Long design times a high development cost for low production volume the lack of silicon designers and the lack of suited design facilities are inherent difficulties to manual full custom chip design To overcome these drawbacks complex systems have to be integrated in ASICs much faster and without losing too much efficiency in silicon area and operation speed compared to handcrafted chips The gap between system design and silicon design can only be bridged by new design CAD The idea of a silicon compiler translating a behavioural system specification directly into silicon was born from the awareness that the

ability to fabricate chips is indeed outrunning the ability to design them At this moment CAD is one order of magnitude behind schedule Conceptual CAD is the keyword to mastering the design complexity in ASIC design and the topic of this book

Bulldog John Rolfe Ellis,1986 This thesis explores the problem of exploiting the parallelism available in emerging multiprocessor architectures Ellis contends that high quality compilers can be written for VLIW Very Long Instruction Word computers These machines drive multiple parallel RISCs Reduced Instruction Set Computers with a single instruction stream Each instruction is long enough to command all of the RISCs at once Exploiting the parallelism in VLIW machines can be difficult so Ellis developed a compiler Bulldog that incorporates a number of optimizations It uses trace scheduling to find more parallelism memory reference and memory bank disambiguation to increase memory bandwidth and a new code generation algorithms

A Compiler for Application-specific Signal Processors Kenneth E. Rimey,1990 I have built a compiler that generates code for a family of application specific digital signal processors developed at Berkeley by members of the Lager project Application specific processors are programmable processors that serve a components of application specific integrated circuits

The Complexity of Robot Motion Planning John Canny,1988 The Complexity of Robot Motion Planning makes original contributions both to robotics and to the analysis of algorithms In this groundbreaking monograph John Canny resolves long standing problems concerning the complexity of motion planning and for the central problem of finding a collision free path for a jointed robot in the presence of obstacles obtains exponential speedups over existing algorithms by applying high powered new mathematical techniques Canny's new algorithm for this generalized movers problem the most studied and basic robot motion planning problem has a single exponential running time and is polynomial for any given robot The algorithm has an optimal running time exponent and is based on the notion of roadmaps one dimensional subsets of the robot's configuration space In deriving the single exponential bound Canny introduces and reveals the power of two tools that have not been previously used in geometrical algorithms the generalized multivariable resultant for a system of polynomials and Whitney's notion of stratified sets He has also developed a novel representation of object orientation based on unnormalized quaternions which reduces the complexity of the algorithms and enhances their practical applicability After dealing with the movers problem the book next attacks and derives several lower bounds on extensions of the problem finding the shortest path among polyhedral obstacles planning with velocity limits and compliant motion planning with uncertainty It introduces a clever technique path encoding that allows a proof of NP hardness for the first two problems and then shows that the general form of compliant motion planning a problem that is the focus of a great deal of recent work in robotics is non deterministic exponential time hard Canny proves this result using a highly original construction John Canny received his doctorate from MIT and is an assistant professor in the Computer Science Division at the University of California Berkeley The Complexity of Robot Motion Planning is the winner of the 1987 ACM Doctoral Dissertation Award
