**Control** Peter Corke, 2017-05-20. Robotic vision the combination of robotics and computer vision involves the application of computer algorithms to data acquired from sensors. The research community has developed a large body of such algorithms but for a newcomer to the field this can be quite daunting. For over 20 years the author has maintained two open source MATLAB Toolboxes one for robotics and one for vision. They provide implementations of many important algorithms and allow users to work with real problems not just trivial examples. This book makes the fundamental algorithms of robotics, vision, and control accessible to all. It weaves together theory, algorithms, and examples in a narrative that covers robotics and computer vision separately and together. Using the latest versions of the Toolboxes the author shows how complex problems can be decomposed and solved using just a few simple lines of code. The topics covered are guided by real problems observed by the author over many years as a practitioner of both robotics and computer vision. It is written in an accessible but informative style easy to read and absorb and includes over 1000 MATLAB and Simulink examples and over 400 figures. The book is a real walk through the fundamentals of mobile robots, arm robots, then camera models, image processing, feature extraction, and multi view geometry and finally bringing it all together with an extensive discussion of visual servo systems.
