Associative Learning For A Robot Intelligence Artificial Intelligence:

Associative Learning For A Robot Intelligence John H Andrae, 1998-09-22 The explanation of brain functioning in terms of the association of ideas has been popular since the 17th century Recently however the process of association has been dismissed as computationally inadequate by prominent cognitive scientists In this book a sharper definition of the term association is used to revive the process by showing that associative learning can indeed be computationally powerful Within an appropriate organization associative learning can be embodied in a robot to realize a human like intelligence which sets its own goals exhibits unique unformalizable behaviour and has no hidden homunculi Some believe that artificial intelligence is undergoing a paradigm shift There are undoubtedly several competing ideas and ideals Neural networks and dynamic systems are offered as alternatives to the information processing and digital computer models of the brain One is asked to decide between symbolic and subsymbolic between algorithmic and nonalgorithmic and between information processing and interactive systems Even in the short distance travelled in this book associative learning is seen to embrace both sides of these dichotomies

An AGI Brain for a Robot John H. Andreae, 2021-03-04 An AGI Brain for a Robot is the first and only book to give a detailed account and practical demonstration of an Artificial General Intelligence AGI The brain is to be implemented in fast parallel hardware and embodied in the head of a robot moving in the real world Associative learning is shown to be a powerful technique for novelty seeking language learning and planning This book is for neuroscientists robot designers psychologists philosophers and anyone curious about the evolution of the human brain and its specialized functions The overarching message of this book is that an AGI as the brain of a robot is within our grasp and would work like our own

brains The featured brain called PP is not a computer program Instead PP is a collection of networks of associations built from J A Fodor s modules and the author s groups The associations are acquired by intimate interaction between PP in its robot body and the real world Simulations of PP in one of two robots in a simple world demonstrate PP learning from the second robot which is under human control Both Professor Daniel C Dennett and Professor Michael A Arbib independently likened the book An AGI Brain for a Robot to Valentino Braitenberg s 1984 book Vehicles Experiments in Synthetic Psychology Daniel C Dennett Professor of Philosophy and Director of Center for Cognitive Studies Tufts University Author of From Bacteria to Bach and Back The Evolution of Minds Michael Arbib a long time expert in brain modeling observed that sometimes a small book can catch the interest of readers where a large book can overwhelm and turn them away He noted in particular the success of Valentino Braitenberg s Vehicles for which he wrote the foreword At a time of explosive interest in AI he suggests that PP and its antics may be just the right way to ease a larger audience into thinking about the technicalities of creating general artificial intelligence Michael A Arbib Professor Emeritus of Computer Science Biomedical Engineering Biological Sciences and Psychology University of Southern California Author of How the Brain Got Language Robots seem to increasingly invade our lives to the point that sometimes seems threatening and other worldly In this small book John Andreae shows some of the basic principles of robotics in ways that are entertaining and easily understood and touch on some of the basic questions of how the mind works Michael C Corballis Professor of Psychology University of Auckland Author of The Recursive Mind A little book that punches far beyond its weight Nicholas Humphrey Emeritus Professor of Psychology London School of Economics Author of Soul Dust The Magic of Consciousness A bold and rich approach to one of the major challenges for neuroscience robotics and philosophy Who will take up Andreae s challenge and implement his model Matthew Cobb Professor of Zoology University of Manchester Author of The Idea of the Brain Here is a book that could change the direction of research into artificial general intelligence in a very productive and profitable way It describes a radical new theory of the brain that goes some way towards answering many difficult questions concerning learning planning language and even consciousness Almost incredibly the theory is operational and expressed in a form that could and should inspire future novel research in AI that transcends existing paradigms Ian H Witten Professor of Computer Science Waikato University Author with Eibe Frank of Data Mining Practical Machine Learning Tools and Techniques **Mind as Machine** Margaret A. Boden, 2006 The development of cognitive science is one of the most remarkable and fascinating intellectual achievements of the modern era It brings together psychology neuroscience artificial intelligence computing philosophy linguistics and anthropology in the project of understanding the mind by modelling its workings Oxford University Press now presents a masterful history of cognitive science told by one of its most eminent practitioners *Machine Ethics and Robot Ethics* Wendell Wallach, Peter Asaro, 2020-09-10 Once the stuff of science fiction recent progress in artificial intelligence robotics and machine learning means that these rapidly advancing technologies are finally coming into

widespread use within everyday life Such rapid development in these areas also brings with it a host of social political and legal issues as well as a rise in public concern and academic interest in the ethical challenges these new technologies pose This volume is a collection of scholarly work from leading figures in the development of both robot ethics and machine ethics it includes essays of historical significance which have become foundational for research in these two new areas of study as well as important recent articles The research articles selected focus on the control and governance of computational systems the exploration of ethical and moral theories using software and robots as laboratories or simulations inquiry into the necessary requirements for moral agency and the basis and boundaries of rights and questions of how best to design systems that are both useful and morally sound Collectively the articles ask what the practical ethical and legal issues arising from the development of robots will be over the next twenty years and how best to address these future considerations

Artificial Intelligence and the Environmental Crisis Keith Ronald Skene, 2019-12-19 A radical and challenging book which argues that artificial intelligence needs a completely different set of foundations based on ecological intelligence rather than human intelligence if it is to deliver on the promise of a better world This can usher in the greatest transformation in human history an age of re integration Our very existence is dependent upon our context within the Earth System and so surely artificial intelligence must also be grounded within this context embracing emergence interconnectedness and real time feedback We discover many positive outcomes across the societal economic and environmental arenas and discuss how this transformation can be delivered Key Features Identifies a key weakness in current AI thinking that threatens any hope of a better world Highlights the importance of realizing that systems theory is an essential foundation for any technology that hopes to positively transform our world Emphasizes the need for a radical new approach to AI based on ecological systems Explains why ecosystem intelligence not human intelligence offers the best framework for AI Examines how this new approach will impact on the three arenas of society environment and economics ushering in a new age of re integration

Consciousness in Humanoid Robots Antonio Chella, Angelo Cangelosi, Giorgio Metta, Selmer Bringsjord, 2019-06-05 Building a conscious robot is a scientific and technological challenge Debates about the possibility of conscious robots and the related positive outcomes and hazards for human beings are today no longer confined to philosophical circles Robot consciousness is a research field aimed at a two part goal on the one hand scholars working in robot consciousness take inspiration from biological consciousness to build robots that present forms of experiential and functional consciousness On the other hand scholars employ robots as tools to better understand biological consciousness Thus part one of the goal concerns the replication of aspects of biological consciousness in robots by unifying a variety of approaches from AI and robotics cognitive robotics epigenetic and affective robotics situated and embodied robotics developmental robotics anticipatory systems and biomimetic robotics Part two of the goal is pursued by employing robots to advance and mark progress in the study of consciousness in humans and animals Notably neuroscientists involved in the

study of consciousness do not exclude the possibility that robots may be conscious This eBook comprises a collection of thirteen manuscripts and an Editorial published by Frontiers in Robotics and Artificial Intelligence under the section Humanoid Robotics and Frontiers in Neurorobotics on the topic Consciousness in Humanoid Robots This compendium aims at collating the most recent theoretical studies models and case studies of machine consciousness that take the humanoid robot as a frame of reference The content in the articles may be applied to many different kinds of robots and to software agents as well
