Fundamentals of Experimental Design Jerome L. Myers, 1979 This the third edition of Fundamentals of Experimental Design has five added chapters those on regression Chapters 12-14 and 15 multivariate analysis Chapter 18 and the matrix algebra appropriate to the level of presentation of this material Chapter 13 I have noted in the preface other additions in this third edition. The added material should enhance the value of the book as a textbook and a reference. Given these additions however alternative approaches in using the current edition as a textbook may merit consideration. It may help to note that Chapters 16 and 17 analysis of covariance trend analysis do not depend on the material in Chapters 12 through 15 although the student should know something about simple linear regression to be able to understand fully the material in Chapters 16 and 17. In any event the instructor who wants to teach only the material in the first two editions can do so by dropping the added chapters 12 through 15 and 18 from the syllabus.

It can be used as a comprehensive up to date textbook for a one semester 3 credit undergraduate course on linear control systems as the first course on this topic at university. This includes the faculties of electrical engineering, mechanical engineering, aerospace engineering, chemical and petroleum engineering, industrial engineering, civil engineering, bio engineering, economics, mathematics, physics, management and social sciences etc. The book covers foundations of linear control systems, their raison d'être, different types of modelling, representations, computations, stability, concepts, tools for time domain and frequency domain analysis and synthesis, and

fundamental limitations with an emphasis on frequency domain methods Every chapter includes a part on further readings where more advanced topics and pertinent references are introduced for further studies The presentation is theoretically firm contemporary and self contained Appendices cover Laplace transform and differential equations dynamics MATLAB and SIMULINK treatise on stability concepts and tools treatise on Routh Hurwitz method random optimization techniques as well as convex and non convex problems and sample midterm and endterm exams The book is divided to the sequel 3 parts plus appendices PART I In this part of the book chapters 1 5 we present foundations of linear control systems This includes the introduction to control systems their raison detre their different types modelling of control systems different methods for their representation and fundamental computations basic stability concepts and tools for both analysis and design basic time domain analysis and design details and the root locus as a stability analysis and synthesis tool PART II In this part of the book Chapters 6 9 we present what is generally referred to as the frequency domain methods This refers to the experiment of applying a sinusoidal input to the system and studying its output There are basically three different methods for representation and studying of the data of the aforementioned frequency response experiment these are the Nyquist plot the Bode diagram and the Krohn Manger Nichols chart We study these methods in details We learn that the output is also a sinusoid with the same frequency but generally with different phase and magnitude By dividing the output by the input we obtain the so called sinusoidal or frequency transfer function of the system which is the same as the transfer function when the Laplace variable s is substituted with Finally we use the Bode diagram for the design process PART III In this part Chapter 10 we introduce some miscellaneous advanced topics under the theme fundamental limitations which should be included in this undergraduate course at least in an introductory level We make bridges between some seemingly disparate aspects of a control system and theoretically complement the previously studied subjects Appendices The book contains seven appendices Appendix A is on the Laplace transform and differential equations Appendix B is an introduction to dynamics Appendix C is an introduction to MATLAB including SIMULINK Appendix D is a survey on stability concepts and tools A glossary and road map of the available stability concepts and tests is provided which is missing even in the research literature Appendix E is a survey on the Routh Hurwitz method also missing in the literature Appendix F is an introduction to random optimization techniques and convex and non convex problems Finally appendix G presents sample midterm and endterm exams which are class tested several times Practical Business Statistics Andrew F.
