**The Intelligent Web** Gautam Shroff,2013-11-28

As we use the Web for social networking shopping and news we leave a personal trail These days linger over a Web page selling lamps and they will turn up at the advertising margins as you move around the Internet reminding you tempting you to make that purchase Search engines such as Google can now look deep into the data on the Web to pull out instances of the words you are looking for And there are pages that collect and assess information to give you a snapshot of changing political opinion These are just basic examples of the growth of Web intelligence as increasingly sophisticated algorithms operate on the vast and growing amount of data on the Web sifting selecting comparing aggregating correcting following simple but powerful rules to decide what matters While original optimism for Artificial Intelligence declined this new kind of machine intelligence is emerging as the Web grows ever larger and more interconnected Gautam Shroff takes us on a journey through the computer science of search natural language text mining machine learning swarm computing and semantic reasoning from Watson to self driving cars This machine intelligence may even mimic at a basic level what happens in the brain

**The Intelligent Web** Jayden Bryant, 2014-11-03 Big data is a relative term describing a situation where the volume velocity and variety of data exceed an organization's storage or compute capacity for accurate and timely decision making Big data is not a single technology but a combination of old and new technologies that helps companies gain actionable insight Therefore big data is the capability to manage a huge volume of disparate data at the right speed and within the right time frame to allow real time analysis and reaction As we note earlier in this chapter big data is typically broken down by three characteristics Volume How much data Velocity How fast that data is processed Variety The various types of data Although it's convenient to simplify big data into the three Vs it can be misleading and overly simplistic For example you may be managing a relatively small amount of very disparate complex data or you may be processing a huge volume of very simple data That simple data may be all structured or all unstructured Even more important is the fourth V veracity How accurate is that data in predicting business value Do the results of a big data analysis actually make sense Determining relevant data is key to delivering value from massive amounts of data However big data is defined less by volume which is a constantly moving target than by its ever increasing variety velocity variability and complexity
