Catalysts are now widely used in both laboratory and industrial scale chemistry. Indeed it is hard to find any complex synthesis or industrial process that does not at some stage utilize a catalytic reaction. The development of homogeneous transition metal catalysts on the laboratory scale has demonstrated that these systems can be far superior to the equivalent heterogeneous systems at least in terms of selectivity. There is an increasing interest in this field of research from both an academic and industrial point of view. In connection with the rapid developments in this area four universities from the EEC Aachen FRG Liege Belgium Milan Italy and Lille France have collaborated to organise a series of seminars for high level students and researchers. These meetings have been sponsored by the Commission of the EEC and state organizations. The most recent of these meetings was held in Lille in September 1985 and this book contains updated and expanded presentations of most of the lectures given there. These lectures are concerned with the field of homogeneous transition metal catalysis and its application to the synthesis of organic intermediates and fine chemicals from an academic and industrial viewpoint. The continuing petroleum crisis which began in the early 1970s has given rise to the need to develop new feedstocks for the chemical industry

**Catalysis** J.A. Moulijn, P.W.N.M. van Leeuwen, R.A. van Santen, 1993-09-09

Catalysis is a multidisciplinary activity which is reflected in this book. The editors have chosen a novel combination of basic disciplines. Homogeneous catalysis by metal complexes is treated jointly with heterogeneous catalysis with metallic and non metallic solids. The main theme of the book is the molecular approach to industrial catalysis. In the introductory section Chapter 1 presents a brief survey of the history of industrial heterogeneous and homogeneous catalysis. Subsequently a selection of current industrial catalytic processes is described. Chapter 2 A broad spectrum of important catalytic applications is presented including the basic chemistry, some engineering aspects, feedstock sources and product utilisation. In Chapter 3 kinetic principles are treated. The section on fundamental catalysis begins with a description of the bonding in complexes and to surfaces. Chapter 4 The elementary steps on complexes and surfaces are described. The chapter on heterogeneous catalysis 5 deals with the mechanistic aspects of three groups of important reactions: syn gas conversion, hydrogenation and oxidation. The main principles of metal and metal oxide catalysis are presented. Likewise the chapter on homogeneous catalysis 6 concentrates on three reactions representing examples from three areas: carbonylation, polymerization and asymmetric catalysis. Identification by in situ techniques has been included. Many constraints to the industrial use of a catalyst have a macroscopic origin. In applied catalysis it is shown how catalytic reaction engineering deals with such macroscopic considerations in heterogeneous as well as homogeneous catalysis. Chapter 7 The transport and kinetic phenomena in both model reactors and industrial reactors are outlined. The section on catalyst preparation Chapters 8 and 9 is concerned with the preparation of catalyst supports zeolites and supported catalysts with an emphasis on general principles and mechanistic

aspects For the supported catalysts the relation between the preparative method and the surface chemistry of the support is highlighted The molecular approach is maintained throughout The first chapter 10 in the section on catalyst characterization summarizes the most common spectroscopic techniques used for the characterisation of heterogeneous catalysts such as XPS Auger EXAFS etc Temperature programmed techniques which have found widespread application in heterogeneous catalysis both in catalyst characterization and simulation of pretreatment procedures are discussed in Chapter 11 A discussion of texture measurement theory and application concludes this section 12 The final chapter 13 gives an outline of current trends in catalysis Two points of view are adopted the first one focusses on developments in process engineering Most often these have their origin in demands by society for better processes The second point of view draws attention to the autonomous developments in catalysis which is becoming one of the frontier sciences of physics and chemistry In this book emphasis is on those reactions catalyzed by heterogeneous and homogeneous catalysts of industrial relevance The integrative treatment of the subject matter involves many disciplines consequently the writing of the book has been a multi author task The editors have carefully planned and harmonized the contents of the chapters *Applied Homogeneous Catalysis* Arno Behr, Thomas Seidensticker, Dieter Vogt, 2025-04-03 One stop reference on homogeneous catalysis from general concepts through detailed examples and industrial applications Accessible and richly illustrated *Applied Homogeneous Catalysis* provides a concise overview of the broad field of homogeneous transition metal catalysis and its applications in the chemical industry This newly revised and updated second edition puts special emphasis on green chemistry sustainable resources and processes The book is divided into five parts Part I presents the basics of transition metal catalysis Part II focuses on process engineering aspects Part III provides details of the most important catalytic reactions Part IV describes catalytic conversions closely related to classical homogeneous transition metal catalysis such as nano electro photo and organocatalysis Part V covers new feedstocks and other topics concluding with an outlook on future challenges of homogeneous catalysis The book contains numerous mechanistic details technical information and illustrative examples The chapters are enlivened by various excursions that relate the content to everyday life or introduce important personalities Didactically the book is completed with learning objectives and take home messages for each chapter as well as more than 400 questions and answers for self testing Written by a team of internationally renowned experts in the field with a wealth of experience in industry and teaching *Applied Homogeneous Catalysis* includes information on Economic importance of industrial homogeneously catalyzed reactions and basics of organometallic chemistry including types of bonds elemental steps and mechanisms Common approaches for separating the homogeneous catalyst from the products after the reaction and using combinatorial chemistry and high throughput screening to achieve optimal results Activating inactive molecules such as carbon dioxide and nitrogen and harnessing homogeneous catalysis for feedstock diversification by recycling polymers or using renewables Providing expansive coverage of the subject *Applied Homogeneous Catalysis* is an essential guide for researchers and

professionals in the pharmaceutical polymer and fine and bulk chemicals industries working on catalysis or entering the field as well as for Master s and PhD students in organic chemistry chemical engineering and related fields
