## The Milky Way

The Milky Way is one of the observable universe's largest and most studied galaxies. It has a distinct barred spiral shape, with a central bar-shaped region made up of older stars, gas, and dust, surrounded by a flat disk of younger stars, gas, and dust. This disk rotates around the center and is estimated to contain trillions of billions of stars and other celestial objects, including black holes, nebulae, and star clusters.

The sun is one of the stars in the Milky Way and is located about 25,000 light years from the galactic center in one of the spiral arms. The Milky Way is constantly changing, with new stars forming from the gas and dust in the disk and older stars dying and exploding as supernovae. The gravity from all of the stars and other objects in the Milky Way helps to keep the galaxy together and maintain its overall structure.

The study of the Milky Way provides valuable information about the structure and evolution of galaxies and the processes that govern the formation and behavior of stars and other celestial objects. It also has important implications for our understanding of the universe and the laws of physics that govern it.

### Did you know?

The name "Milky Way" dates back to ancient times when different cultures knew it as a "way of milk" or "milky way". In ancient Greece, the term

## Task - Drawing the Milky Way

### What are steps to do?

1. Start by drawing a large circle on the middle page of the Milky Way.
2. Draw a smaller inner circle in the center of the first circle.
3. Add smaller circles on either side of the inner circle, gas, and dust.
4. Add smaller spiral arms and additional smaller outer circles.
5. Use shading to give the Milky Way a 3D effect in the central bar, and
6. Finally, use an eraser to soften any pencil and colors.

### Alpha Centauri

Alpha Centauri is a star system located 4.3 light years away from the Sun in the constellation Centaurus. It is the second closest star system to our solar system. Alpha Centauri A and B, the two largest stars in the system, are of mass and a little over. Alpha Centauri B, Alpha Centauri A, and the Sun, are similar in size and mass to the Sun and are among the brightest stars in the night sky. Alpha Centauri is the brightest of the two stars of the Southern Cross constellation. Proxima Centauri is a red dwarf star and is the closest known star to the Sun at a distance of approximately 4.3 light years. The Alpha Centauri system has four main celestial objects: a star, a binary star, a white dwarf, and a planet known as Proxima b.

### Light Years, Hours, and Minutes: An Astronomical Units

A light year is a unit of measurement. Astronomers use the distance that light travels in one year as a measure when it is necessary. The below table shows:

A light hour is a unit of distance equal to the distance that light travels in one hour. Approximately 1.08 million kilometers.

A light minute is a unit of distance equal to the distance that light travels in one minute. Approximately 16,000 kilometers.

The distance between planets in our solar system are measured in astronomical units (AU), one light year, or they are very small compared to the size of the Sun or stars. For example, the distance between Mercury and the Sun is about 0.39 astronomical units (AU). It is not possible to look over the distance between the planets in our solar system in one day because it requires

≈ 316 years!  
Earth is approximately  
93.0 million miles from Sun  
63.0 million miles from Venus  
12.8 million miles from Earth  
19.2 million miles from Mars  
147.6 million miles from Jupiter  
493.3 million miles from Saturn  
587.5 million miles from Uranus  
981.9 million miles from Neptune  
Pluto is approximately  
3.67 billion miles from Sun
