Basic Retrosynthesis Problems 2014:

Microbial Cell Factories Engineering for Production of Biomolecules Vijai Singh, 2021-02-13 Microbial Cell Factories Engineering for Production of Biomolecules presents a compilation of chapters written by eminent scientists worldwide. Sections cover major tools and technologies for DNA synthesis, design of biosynthetic pathways, synthetic biology tools, biosensors, cell-free systems, computer-aided design, OMICS tools, CRISPR-Cas systems, and many more. Although it is not easy to find relevant information collated in a single volume, the book covers the production of a wide range of biomolecules from several MCFs including *Escherichia coli*, *Bacillus subtilis*, *Pseudomonas putida*, *Streptomyces*, *Corynebacterium*, *Cyanobacteria*, *Saccharomyces cerevisiae*, *Pichia pastoris*, and *Yarrowia lipolytica*, and algae among many others. This will be an excellent platform from which scientific knowledge can grow and widen in MCF engineering research for the production of biomolecules. Needless to say, the book is a valuable source of information not only for researchers designing cell factories but also for students, metabolic engineers, synthetic biologists, genome engineers, industrialists, stakeholders, and policymakers interested in harnessing the potential of MCFs in several fields. Offers basic understanding and a clear picture of various MCFs. Explains several tools and technologies including DNA synthesis, synthetic biology tools, genome editing, biosensors, computer-aided design, and OMICS tools among others. Harnesses the potential of engineered MCFs to produce a wide range of biomolecules for industrial, therapeutic, pharmaceutical, nutraceutical, and biotechnological applications. Highlights the advances, challenges, and future opportunities in designing MCFs.

Authoritative and cutting-edge *RNA Design: Methods and Protocols* aims to ensure successful results in the further study of this vital field.

Virtual Drug Design Daniela Schuster, Honglin Li, 2020-01-13 In the current drug research environment in academia and industry, cheminformatics and virtual screening methods are well established and integrated tools. Computational tools are used to predict a compound's 3D structure, the 3D structure and function of a pharmacological target, ligand-target interactions, binding energies, and other factors essential for a successful drug. This includes molecular properties such as solubility, logP value, susceptibility to metabolism, cell permeation, blood-brain barrier permeation, interaction with drug transporters, and potential off-target effects. Given that approximately 40 million unique compounds are readily available for purchase, such computational modeling and filtering tools are essential to support the drug discovery and development process. The aim of all these calculations is to focus experimental efforts on the most promising candidates and exclude problematic compounds early in the project. In this Research Topic on virtual activity

predictions we cover several aspects of this research area such as historical perspectives data sources ligand treatment virtual screening methods hit list handling and filtering
