

5. An air-filled circular waveguide of radius  $a$  has a conducting plate placed along its length at  $\phi = 0$  extending from  $\rho = 0$  to  $a$ , as shown in Figure below.

- i) For the TE modes, derive expressions for the cutoff frequencies and propagation constant,  $\beta$ , along the axis of the guide.

**Hint:** Follow the derivation in the textbook for circular waveguide (Section 3.4) but now with additional Boundary Conditions for the tangential electric field at  $\phi = 0$  and  $\phi = 2\pi$ .

Fields, Waves and Transmission Lines M. Benson, 2012-12-06 One of us FAB published a book Problems in Electronics with Solutions in 1957 which became well established and ran to five editions the last revised and enlarged edition appearing in 1976 When the first edition was written it covered almost the complete undergraduate electronics courses in engineering at universities One book at a price students can afford can no longer cover an undergraduate course in electronics It has therefore been decided to produce a book covering one important section of such a course using the experience gained and a few problems from previous editions of Problems in Electronics with Solutions The book is based largely on problems collected by us over many years and given to undergraduate electronic and electrical engineers Its purpose is to present the problems together with a large number of their solutions in the hope that it will prove valuable to undergraduates and other teachers It should also be useful for Master's degree students in electronic and electrical engineering and physics research workers engineers and scientists in industry and as a reference source

Ali Hamed, 2018-04-09 Electromagnetics for Engineering Students is a textbook in two parts Part I and II that cover all topics of electromagnetics needed for undergraduate students from vector analysis to antenna principles In both parts of the book the topics are presented in sufficient details such that the students will follow the analytical development easily Each chapter is supported by many illustrative examples solved problems and the end of chapter problems to explain the principles of the topics and

enhance the knowledge of the student. There are a total of 681 problems in the both parts of the book as follows 162 illustrative examples 88 solved problems and 431 end of chapter problems. This part is a continuation of Part I and focuses on the application of Maxwell's equations and the concepts that are covered in Part I to analyze the characteristics of wave propagation in half space and bounded media including metamaterials. Moreover a chapter has been devoted to the topic of antennas to provide readers with the fundamental concepts related to antenna engineering. The key features of this part. In addition to the coverage of classical topics in electromagnetic normally covered in the similar available texts this part of the book adds some advanced concepts and topics such as Application of multi pole expansion for vector potentials. More detailed analysis on the topic of waveguides including circular waveguides. Refraction through metamaterials and the concept of negative refractive index.
