Performance An Engineering Approach introduces flight performance analysis techniques that enable readers to determine performance and flight capabilities of aircraft. Flight performance analysis for prop driven and jet aircraft is explored, supported by examples and illustrations many in full color. MATLAB programming for performance analysis is included and coverage of modern aircraft types is emphasized. The text builds a strong foundation for advanced coursework in aircraft design and performance analysis. **Subject Guide to Books in Print**, 1996    Railway Noise and Vibration David

Thompson, 2008-12-11 Railways are an environmentally friendly means of transport well suited to modern society. However, noise and vibration are key obstacles to further development of the railway networks for high speed intercity traffic for freight and for suburban metros and light rail. All too often noise problems are dealt with inefficiently due to lack of understanding of the problem. This book brings together coverage of the theory of railway noise and vibration with practical applications of noise control technology at source to solve noise and vibration problems from railways. Each source of noise and vibration is described in a systematic way: rolling noise, curve squeal, bridge noise, aerodynamic noise, ground vibration and ground borne noise, and vehicle interior noise. Theoretical modelling approaches are introduced for each source in a tutorial fashion. Practical applications of noise control technology are presented using the theoretical models. Extensive examples of application to noise reduction techniques are included. **Railway Noise and Vibration** is a hard working reference and will be invaluable to all who have to deal with noise and vibration from railways whether working in the industry or in consultancy or academic research. David Thompson is Professor of Railway Noise and Vibration at the Institute of Sound and Vibration Research, University of Southampton. He has worked in the field of railway noise since 1980 with British Rail Research in Derby, UK and TNO Institute of Applied Physics in the Netherlands before moving to Southampton in 1996. He was responsible for developing the TWINS software for predicting rolling noise. Discusses fully the theoretical background and practical workings of railway noise. Includes the latest research findings brought together in one place. Forms an extended case study in the application of noise control techniques. **Books in Print**, 1979    **Mergent International**
