

# A Guide to Trigonometry for Beginners

## Teaching Approach

When teaching trigonometry, start with a recap the theorem of Pythagoras followed by defining the trigonometric ratios in a right angles triangle. A lot of examples are recommended to ensure proper understanding in recognizing the opposite, adjacent and hypotenuse sides. Triangles with the numerical length of sides and algebraic lengths of sides are recommended.

The proper use of the calculator must be stressed. Learners must not be restricted to just remembering the important keys, but a proper explanation of the reasoning behind pressing the sin, cos and tan keys, compared to Shift sin, Shift cos and Shift tan. The responsibility lies with the learners to ensure that their calculator is set in degrees.

Once learners are able to solve angles and sides in right angled triangles, the link to similar triangles can be bridged. The important concept of sides in the same ratio does not affect the angle. This concept can be further developed by using similar triangles to determine angles and sides of triangles which otherwise would be difficult to determine. The following example will illustrate this point:

We can use similar triangles to determine the height of the tree in the example

The shadow that a tree casts is used in the following way: we put a pole of a certain height (example 2m) in the line of the shadow, we measure the distance from the tree to where the shadow hits the horizontal (example 20m) and measuring the distance from the pole to where the shadow hits the horizontal (8m), we can use similar triangles and trigonometric ratios in the following way to determine the height of the tree:
