**by Games** Wilfrid Hodges,1985-05-02 This book introduces a general method for building infinite mathematical structures and surveys its applications in algebra and model theory The basic idea behind the method is to build a structure by a procedure with infinitely many steps similar to a game between two players that goes on indefinitely The approach is new and helps to simplify motivate and unify a wide range of constructions that were previously carried out separately and by ad hoc methods The first chapter provides a resume of basic model theory A wide variety of algebraic applications are studied with detailed analyses of existentially closed groups of class 2 Another chapter describes the classical model theoretic form of this method of construction which is known variously as omitting types forcing or the Henkin Orey theorem The last three chapters are more specialised and discuss how the same idea can be used to build uncountable structures Applications include completeness for Magidor Malitz quantifiers and Shelah s recent and sophisticated omitting types theorem for L Q There are also applications to Boolean algebras and models of arithmetic
