Principles

In programming contexts, the term *string* usually refers to a sequence of characters. For example, *ABC* is a string of three characters. Strings are more prevalent in computing than is generally realized. In most cases, computer input is in the form of strings, e.g., commands entered at a terminal. Similarly, computer output is in the form of strings; printed lines are simply strings of characters. In spite of this fact, string processing has received comparatively little attention.

Strings and String Processing

The facilities of the most widely used and well-known programming languages are concentrated on numerical and business data processing. However, a substantial amount of string processing is performed. For example, compilers accept strings as input, analyze them, and usually produce other strings as output. Command interpreters analyze command strings and perform appropriate actions. These kinds of programs are used heavily, so they must be extremely efficient. For this reason, they are usually written in systems programming languages, e.g., C, rather than in higher-level string-processing languages.

Nevertheless, higher-level string-processing languages offer many advantages for solving complex problems. Examples of such problems are language translation, computational linguistics, symbolic mathematics, text editing, and document formatting.
