1. The first step in solving a system of linear equations is to write the equations in slope-intercept form. This means that each equation should be written in the form $y = mx + b$, where m is the slope and b is the y-intercept. Once the equations are in slope-intercept form, you can use the substitution method to solve the system. This involves substituting the expression for y from one equation into the other equation, and then solving for x . Once you have found the value of x , you can substitute it back into one of the original equations to find the value of y .

2. The second step in solving a system of linear equations is to graph the equations. This involves plotting the equations on a coordinate plane. The x-axis and y-axis are labeled, and the equations are plotted as lines. The point where the two lines intersect is the solution to the system.
