Bilateral Filtering

Bilateral Filtering Sylvain Paris,Pierre Kornprobst,Jack Tumblin,Frédo Durand,2009-08-20 Bilateral filtering is one of the most popular image processing techniques The bilateral filter is a nonlinear process that can blur an image while respecting strong edges Its ability to decompose an image into different scales without causing haloes after modification has made it ubiquitous in computational photography applications such as tone mapping style transfer relighting and denoising Bilateral Filtering Theory and Applications provides a graphical intuitive introduction to bilateral filtering a practical guide for efficient implementation an overview of its numerous applications as well as mathematical analysis This broad and detailed overview covers theoretical and practical issues that will be useful to researchers and software developers

High Performance, Three-Dimensional Bilateral Filtering ,2008 Image smoothing is a fundamental operation in computer vision and image processing This work has two main thrusts 1 implementation of a bilateral filter suitable for use in smoothing or denoising 3D volumetric data 2 implementation of the 3D bilateral filter in three different parallelization models along with parallel performance studies on two modern HPC architectures Our bilateral filter formulation is based upon the work of Tomasi 11 but extended to 3D for use on volumetric data Our three parallel implementations use POSIX threads the Message Passing Interface MPI and Unified Parallel C UPC a Partitioned Global Address Space PGAS language Our parallel performance studies which were conducted on a Cray XT4 supercomputer and aquad socket quad core Opteron workstation show our algorithm to have near perfect scalability up to 120 processors Parallel algorithms such as the one we present here will have an increasingly important role for use in production visual analysis systems as the underlying computational platforms transition from single to multi core architectures in the future

Danny Barash,Hewlett-Packard Laboratories,2000 [High-dimensional Gaussian Filtering for Computational Photography](#) Andrew Bensley Adams,2011 Over the last decade digital imaging has become ubiquitous The advent of cheap digital cameras and the inclusion of cameras in almost all mobile devices has made photography one of the basic ways in which people record and communicate experiences The ubiquity of cameras has imposed new constraints on their physical form Camera modules are expected to be thin light and cheap These restrictions make the production of high quality images challenging We turn to increasingly sophisticated algorithmic tools to transform the raw data captured by a camera into a photograph This dissertation focuses on one such family of algorithmic tools those expressible as a Gauss transform One popular technique in this family is the bilateral filter which smooths the fine detail in an image without crossing strong edges It can be used to isolate and control the sharpness tone and contrast of a photograph at various scales Its relatives the joint bilateral filter and the joint bilateral upsample allow for the fusion of data from multiple images Another popular technique in the same family is non local means which denoises an image by replacing each pixel with the average color of all other pixels in the image with a similar local neighborhood A naive implementation of these algorithms is prohibitively slow This

dissertation unifies these algorithms under a common framework describes a variety of applications of the transform in photographic image processing and presents two new data structures to accelerate the computation of such transforms the permutohedral lattice and the Gaussian kd tree

Edge Detection with Bilateral Filtering in Spiral Architecture Qimei Hu,2004 *Image Processing* ,2007 **Impact of Bilateral Filter Parameters on Medical Image**

Noise Reduction and Edge Preservation Michael D. Lekan,2009 The objective of this paper is to examine the bilateral filter and its application to digital medical imaging The bilateral filter is a non linear adaptive smoothing filter which is capable of preserving the edges of image structures Selection of the bilateral filter s parameters greatly influence how well an image is smoothed and how well edges are preserved The parameters of the bilateral filter were analyzed individually The noise reduction for each parameter is related to the much simpler box averaging filter Edges were also analyzed for each parameter Techniques for proper parameter selection are studied and general guidelines are suggested After the properties of each parameter were examined they were recombined and applied to CT images Solutions addressing the limitations of this filter for high noise CT images are also considered It was found that the bilateral filter is capable of providing effective smoothing and at the same time preserves edges which are otherwise blurred by other filters The viability of this filter greatly depends on the selection of its parameters
