Investigation Of Methods For The Extraction Of Polyphenols From Grape (Vitis Vinifera L.) Pomace Gagan Sharma,2020 Grapes Vitis vinifera L are one of the largest food crops grown in the world with global production of around 77.8 million tons They are primarily used for wine production 85% of which approximately 10 million tons give rise to solid waste pomace Pomace or Wine Marc consists of grape skin seeds and stalks and their proportion depends on the grape variety Pomace is an excellent source of bioactive compounds such as polyphenols flavonoids and dietary fibers which could be further processed to yield nutraceuticals that can be used in the food pharmaceutical and cosmetic industries Conventional extraction methods such as heat reflux Soxhlet and solvent extraction are energy and time intensive and often generate lower yield Advanced techniques including microwave assisted extraction MBE and ultrasound can be used to overcome the constraints of conventional processes The objective of this thesis is to intensify the extraction yield of bioactive components from grape pomace using advance extraction techniques including MBE and ultrasound by evaluating the effect of process parameters including type of solvent solvent concentration extraction time and temperature Total polyphenol concentration was quantified using Folin Ciocalteau method and antioxidant activity was quantified using free radical scavenging techniques including 2,2-diphenyl 1-picrylhydrazyl DPPH and Fe³⁺ tripyridyltriazine FRAP It was observed that MBE process yielded high concentration of polyphenols in comparison to ultrasound and convention heat reflux methods
