**Advancements in Electric Machines** J. F. Gieras, 2008-11-14 Traditionally electrical machines are classified into d c commutator brushed machines induction asynchronous machines and synchronous machines These three types of electrical machines are still regarded in many academic curricula as fundamental types despite that d c brushed machines except small machines have been gradually abandoned and PM brushless machines PMBM and switched reluctance machines SRM have been in mass production and use for at least two decades Recently new topologies of high torque density motors high speed motors integrated motor drives and special motors have been developed Progress in electric machines technology is stimulated by new materials new areas of applications impact of power electronics need for energy saving and new technological challenges The development of electric machines in the next few years will mostly be stimulated by computer hardware residential and public applications and transportation systems land sea and air At many Universities teaching and research strategy oriented towards electrical machinery is not up to date and has not been changed in some countries almost since the end of the WWII In spite of many excellent academic research

achievements the academia industry collaboration and technology transfer are underestimated or quite often neglected Underestimation of the role of industry unfamiliarity with new trends and restraint from technology transfer results with time in lack of external financial support and drastic decline in the number of students interested in Power Electrical Engineering

*Stratospheric Flight* Andras Sóbester, 2011-06-28 In this book Dr Andras Sobester reviews the science behind high altitude flight. He takes the reader on a journey that begins with the complex physiological questions involved in taking humans into the death zone. How does the body react to falling ambient pressure? Why is hypoxia oxygen deficiency associated with low air pressure so dangerous and why is it so difficult to design out of aircraft? Why does it still cause fatalities in the 21st century? What cabin pressures are air passengers and military pilots exposed to and why is the choice of an appropriate range of values such a difficult problem? How do high altitude life support systems work and what happens if they fail? What happens if cabin pressure is lost suddenly or even worse slowly and unnoticed? The second part of the book tackles the aeronautical problems of flying in the upper atmosphere. What loads does stratospheric flight place on pressurized cabins at high altitude and why are these difficult to predict? What determines the maximum altitude an aircraft can climb to? What is the coffin corner and how can it be avoided? The history of aviation has seen a handful of airplanes reach altitudes in excess of 70 000 feet what are the extreme engineering challenges of climbing into the upper stratosphere? Flying high makes very high speeds possible what are the practical limits? The key advantage of stratospheric flight is that the aircraft will be above the weather but is this always the case? Part three of the book investigates the extreme atmospheric conditions that may be encountered in the upper atmosphere. How high can a storm cell reach and what is it like to fly into one? How frequent is high altitude clear air turbulence what causes it and what are its effects on aircraft? The stratosphere can be extremely cold how cold does it have to be before flight becomes unsafe? What happens when an aircraft encounters volcanic ash at high altitude? Very high winds can be encountered at the lower boundary of the stratosphere what effect do they have on aviation? Finally part four looks at the extreme limits of stratospheric flight. How high will a winged aircraft will ever be able to fly? What are the ultimate altitude limits of ballooning? What is the greatest altitude that you could still bail out from? And finally what are the challenges of exploring the stratospheres of other planets and moons? The author discusses these and many other questions the known knowns the known unknowns and the potential unknown unknowns of stratospheric flight through a series of notable moments of the recent history of mankind's forays into the upper atmospheres each of these incidents accidents or great triumphs illustrating a key aspect of what makes stratospheric flight aviation at the limit. *Airways*, 2007 Scientific and Technical Aerospace Reports, 1985 QF32 Richard de Crespigny, 2012-08-01 QF32 is the award winning bestseller from Richard de Crespigny author of the forthcoming *Fly Life Lessons from the Cockpit of QF32*. On 4 November 2010 a flight from Singapore to Sydney came within a knife edge of being one of the world's worst air disasters. Shortly after leaving Changi Airport an explosion shattered Engine 2 of Qantas flight QF32 an Airbus A380 the largest and

most advanced passenger plane ever built Hundreds of pieces of shrapnel ripped through the wing and fuselage creating chaos as vital flight systems and back ups were destroyed or degraded In other hands the plane might have been lost with all 469 people on board but a supremely experienced flight crew led by Captain Richard de Crespigny managed to land the crippled aircraft and safely disembark the passengers after hours of nerve racking effort Tracing Richard's life and career up until that fateful flight QF32 shows exactly what goes into the making of a top level airline pilot and the extraordinary skills and training needed to keep us safe in the air Fascinating in its detail and vividly compelling in its narrative QF32 is the riveting blow by blow story of just what happens when things go badly wrong in the air told by the captain himself Winner of ABIA Awards for Best General Non fiction Book of the Year 2013 and Indie Awards Best Non fiction 2012 Shortlisted ABIA Awards Book of the Year 2013
