do sistema estimada utilizando-se da Transformada R pida de Fourier associada a uma técnica de janelamento exponencial dos sinais envolvidos. Os ganhos do controlador PID são encontrados ajustando-se a resposta do sistema controlador a uma resposta desejada nas regras onde a FRF identificada com confiança. A segunda metodologia simplificada requer a identificação de apenas dois pontos da FRF do sistema. São propostos ensaios que identificam estes pontos e os ganhos do PID são obtidos a partir da solução de um sistema de equações algébricas. Os resultados são avaliados numericamente para um exemplo expressivo de processos e experimentalmente em três sistemas: um sistema de 1 grau de liberdade com 3 gdl e uma viga engastada livre com atuadores piezotáticos incorporados. O trabalho conclui que as metodologias propostas são eficientes para um espectro amplo de sistemas dentre os quais os sistemas oscilatórios de baixo amortecimento e vibras freqüências naturais. Aponta-se para a necessidade de estudos futuros que investiguem a implementação tecnológica dos novos procedimentos em Processadores Digitais de Sinais de baixo custo e que avaliem a sintonia de controladores com estruturas mais complexas que o PID empregados a sistemas de múltiplas entradas e múltiplas saídas.

*Non-parametric Tuning of PID Controllers* Igor Boiko, 2012-08-22

The relay feedback test RFT has become a popular and efficient method in process identification and automatic controller tuning. Non parametric Tuning of PID Controllers couples new modifications of classical RFT with application specific optimal tuning rules to form a non parametric method of test and tuning. Test and tuning are coordinated through a set of common parameters so that a PID controller can obtain the desired gain or phase margins in a system exactly even with unknown process dynamics. The concept of process specific optimal tuning rules in the nonparametric setup with corresponding tuning rules for flow level pressure and temperature control loops is presented in the text. Common problems of tuning accuracy based on parametric and non parametric approaches are addressed. In addition the text treats the parametric approach to tuning based on the modified RFT approach and the exact model of oscillations in the system under test using the locus of a perturbed relay system LPRS method. Industrial loop tuning for distributed control systems using modified RFT is also described. Many of the problems of tuning rules optimization and identification with modified RFT are accompanied by MATLAB code downloadable from <http://extras.springer.com/978-1-4471-4464-9> to allow the reader to duplicate the results. Non parametric Tuning of PID Controllers is written for readers with previous knowledge of linear control and will be of interest to academic control researchers and graduate students and to practitioners working in a variety of chemical, mechanical and process engineering related industries.
