System Implementation and Adaptation Evaluation in Adaptive Web-Based Systems

Bujar Raufi

Abstract: This paper addresses the issue of implementation and evaluation of adaptation algorithm for Adaptive Web-Based Systems. The proposed architectural model of the system is consisted of two logical modes: Online and Offline mode, whilst the evaluation of the adaptation algorithm is done by using two criteria. The first one is measuring the performance of the Adaptation Algorithm through recall, precision and f-score measurements and the second is the measurement of the degree of the overall degree of navigation help offered to the user through web usability questionnaires.

Experimental results indicate a good performance of the algorithm which renders it suitable for performing online adaptation for Adaptive Web-Based Systems.

Key words: Computer Systems and Technologies, Adaptive Web-Based Systems, Adaptation Algorithm.

INTRODUCTION

Proliferation of the web in the recent years together with the increase of new applications and web phenomena's has made it a place where information is not simply searched, browsed and read, but also can be adapted in various ways for the single goal, meeting user's needs. The second part of the above mentioned clause is being done through the use of *Adaptive Web-Based Systems*. Adaptive Web-Based Systems represent systems that tend to arrange its internal link structure, content or both based on user access patterns.

In [5] we have introduced a layered framework which addresses the issue of complexity in adaptive web-based systems. The proposed framework ensures:

- **Flexibility**: that offers quicker discovery of new knowledge and the reuse of the existing.
- **Expressiveness**: allows extensive usage of semantic web technologies in the sense of good manipulation and reasoning with the knowledge at hand.
- **Interoperability**: offers sharing and accessing data from other resources for performing adaptation (In case of open corpus adaptation).
- **Modularity**: that allows a certain degree of independence between layers.

The proposed layered framework is consisted of five layers described as [5]:

- *Data Layer* where all the data and the site's link structure resides. Also this is the layer where the atomic information is located with the precedence and next links as well as information weights.
- *Concept Layer* represents the semantic layer of the system. Consisted of concepts and concept relationship.
- *User Layer* where user preferences like access patterns and user behaviour are collected and used to perform adaptation.
- *Adaptation Layer* which performs the adaptation process based on knowledge gained from concept layer and user layer.
- Finally the *Presentation Layer* is what the user sees at the end as a final product of adaptation. In this stage, a rearrangement of atomic pieces of information or whole pages is done In order to meet the adaptation goal posed in adaptation layer.
