This report provides technical information on pervious concrete's applications, design methods, materials, properties, mixture proportioning, construction methods, testing, and inspection.

The term "pervious concrete" typically describes a porous, open-grained material consisting of portland cement, coarse aggregate, fine aggregate, admixtures, and water. The combination of these ingredients will produce a bonded material with connected pores, ranging in size from 0.08 to 0.82 in. (2 to 20 mm), that allow water to pass through easily. The void content can range from 20 to 30%, with typical compressive strengths of 400 to 4000 psi (2.8 to 28 MPa). The drainage rate of pervious concrete pavements will vary with aggregate size and density of the mixture, but will generally fall into the range of 2 to 10 gallons/ft<sup>2</sup> (80 to 720 L/meter<sup>2</sup>).

Keywords: construction; design; drainage; permeability; pervious concrete; pavement; proportioning; testing.

ACI Committee Reports, Guides, and Commentaries are intended for guidance in planning, developing, executing, and inspecting construction. This document is intended for the use of individuals who are competent to evaluate the significance and limitations of its content and recommendations and who will accept responsibility for the application of the material it contains. Ready Mix TVRM sponsored a study involving field and laboratory testing on numerous placement segments of the 4700 yd<sup>3</sup> 8 acres of pervious pavement supplied to the Prime Outlet Mall project in Williamsburg Virginia 2008 The intent of the study was to gather a statistically sufficient quantity of test data of plastic and hardened properties using ASTM test standards from a project large in square footage to provide such data The TVRM approach involved representative sampling plastic and hardened density testing void % determination thickness measurements and compressive and flexural strength testing The hardened test specimens were obtained by coring and sawing from precast panels cast onsite during pavement production The test panels measuring 3 ft x 3 ft x 6 in in depth had supporting bottoms and was cast from composite samples obtained at the project site The test panels were cast and cured in the same manner as the pervious pavement one test panel for every 150 to 200 yd<sup>3</sup> The test panels were cured a minimum of 7 days to promote the necessary aggregate cement paste bond development as is referenced in ACI 522 1 08 ACI 522 1 Specification for Pervious Concrete Pavement American Concrete Institute Farmington Hills MI 2008 Once the curing was complete the pervious test panels were cushioned and transported to the TVRM laboratory for further curing and hardened strength and density testing The TVRM objective was to compile enough raw data with consistent test results to help designers and specifiers in designing for future pervious projects
