

The major challenge facing the portable computer industry is the development of cost-effective, low-power, full-screen, flat panel displays. Here is a technology that can help.

Active-Matrix Liquid Crystal Displays Using Amorphous Silicon Thin-Film Transistors

H. A. Fieszk and S. H. Fahnberg
Alphasil, Inc.

During the last two decades, a number of industries have improved the hope that semiconductor technology would develop into a valuable new thin-film semiconductor technology.¹⁻⁴ Amorphous Silicon Thin-Film Transistors (TFT) technology has now developed to the point that large-area, high-density, liquid crystal displays can be produced with acceptable yields and at reasonable cost. Although basic TFT technology can be applied to a broad spectrum of product applications areas, including microprocessors and radiation-hardened integrated circuits, clearly flat panel displays for use in portable computers offer the most immediate commercial potential.

Background

As integrated circuit technology moves toward the million transistor chip and small, multichip modules, compact disk drives become available, the ability to pack tremendous computing power into small, lightweight packages is becoming a reality. Shrinking die size, increasing clock rates, and the availability of sophisticated software have contributed to this process.

The limiting factor in the design of smaller, full-function, truly portable computer systems is the machine-human interface. The keyboard is likely to remain the primary input device for some time. The future of voice recognition depends on increased processing power and the development of voice recognition software. Since a person can speak as fast as five to six characters per second, voice recognition should not decrease the data transfer rate. Nor should

data be a burden to command scope in many applications. A similar analysis, however, does not apply to machine-to-human output.

Machine voice output involves significant performance degradation in many applications, when compared with standard video terminal output. While voice output may be limited to a few words per second, video output can be orders of magnitude higher. Additionally, many pointer functions such as word processing formatting, spreadsheet display, and graphics presentation are simply not acceptable in machine voice output. Thus, the major challenge facing the portable computer industry is the development of cost-effective, low-power, full-screen flat panel displays.

Cathode ray tube technology will not produce the output device of choice for the portable computer market. The disadvantages of power consumption, weight, and size are formidable.

Qualities

Many data sources indicate that annual sales of portable computers will exceed several million units by the late 1980's, with vigorous continued growth expected. To foster and participate in this market, flat panel display manufacturers should offer several desirable qualities to their products.

The cost of flat panel displays to computer system manufacturers, whether such displays are purchased or produced internally, must be comparable to the cost of a
