*Synthetic Biology* Joachim Boldt, 2015-11-26 Assessing synthetic biology from a societal and ethical perspective is not only a matter of determining possible harms and benefits of synthetic biology applications Synthetic biology also incorporates a specific technoscientific understanding of its research agenda and its research objects that has philosophical and ethical implications This edited volume sets out to explore and evaluate these synthetic biology worldviews and it proposes appropriate governance measures In addition legal challenges are discussed

## Synthetic Biology engineering complexity and refactoring cell capabilities

Pablo Carbonell, Jean Marie François, 2015-10-26 One of the key features of biological systems is complexity where the behavior of high level structures is more than the sum of the direct interactions between single components Synthetic Biologists aim to use rational design to build new systems that do not already exist in nature and that exhibit useful biological functions with different levels of complexity One such case is metabolic engineering where with the advent of genetic and protein engineering by supplying cells with chemically synthesized non natural amino acids and sugars as new building blocks it is now becoming feasible to introduce novel physical and chemical functions and properties into biological entities The rules of how complex behaviors arise however are not yet well understood For instance instead of considering cells as inert chassis in which synthetic devices could be easily operated to impart new functions the presence of these systems may impact cell physiology with reported effects on transcription translation metabolic fitness and optimal resource allocation The result of these changes in the chassis may be failure of the synthetic device unexpected or reduced device behavior or perhaps a more permissive environment in which the synthetic device is allowed to function While new efforts have already been made to increase standardization and characterization of biological components in order to have well known parts as building blocks for the construction of more complex devices also new strategies are emerging to better understand the biological dynamics underlying the phenomena we observe For example it has been shown that the features of single biological components i e promoter strength ribosome binding affinity etc change depending on the context where the sequences are allocated Thus new technical approaches have been adopted to preserve single components activity as genomic insulation or the utilization of prediction algorithms able to take biological context into account There have been noteworthy advances for synthetic biology in clinical technologies biofuel production and pharmaceuticals production also metabolic engineering combined with microbial selection adaptation and fermentation processes allowed to make remarkable progress towards bio products formation such as bioethanol succinate malate and more interestingly heterologous products

or even non natural metabolites However despite the many progresses it is still clear that ad hoc trial and error predominates over purely bottom up rational design approaches in the synthetic biology community In this scenario modelling approaches are often used as a descriptive tool rather than for the prediction of complex behaviors The initial confidence on a pure reductionist approach to the biological world has left space to a new and deeper investigation of the complexity of biological processes to gain new insights and broaden the categories of synthetic biology In this Research Topic we host contributions that explore and address two areas of Synthetic Biology at the intersection between rational design and natural complexity 1 the impact of synthetic devices on the host cell or chassis and 2 the impact of context on the synthetic devices Particular attention will be given to the application of these principles to the rewiring of cell metabolism in a bottom up fashion to produce non natural metabolites or chemicals that should eventually serve as a substitute for petrol derived chemicals and on a long term view to provide economical ecological and ethical solutions to today's energetic and societal challenges

[Nano-\(Bio\)Catalysis in Lignocellulosic Biomass Valorization](#) Rafael Luque, Christophe Len, Konstantinos Triantafyllidis, 2019-03-01 The valorization of lignocellulosic biomass in the form of forest and agricultural wastes industrial processing side streams and dedicated energy crops toward chemicals fuels and added value products has become a major research area with increasing exploitation potential The efficient and tailored depolymerization of biomass or its primary structural components hemicellulose cellulose and lignin to platform chemicals i e sugars phenolics furans ketones organic acids etc is highly dependent on the development of novel or modified chemo and bio catalytic processes that take into account the peculiarities and recalcitrance of biomass as feedstock compared for example to petroleum fractions The present Research Topic in Frontiers in Chemistry Section of Green and Sustainable Chemistry entitled Nano bio catalysis in lignocellulosic biomass valorization aims to further contribute to the momentum of research and development in the bio catalytic conversion of biomass by featuring original research papers as well as two review papers authored and reviewed by experts in the field The Research Topic addresses various representative reactions and processes in biomass valorization highlighting the importance of developing novel efficient and stable nano bio catalysts with tailored properties according to the nature of the reactant feedstock and the targeted products
