Bioinformatics David Edwards, Jason Stajich, David Hansen, 2009-09-03. Bioinformatics is a relatively new field of research. It evolved from the requirement to process, characterize and apply the information being produced by DNA sequencing technology. The production of DNA sequence data continues to grow exponentially. At the same time, improved bioinformatics such as faster DNA sequence search methods have been combined with increasingly powerful computer systems to process this information. Methods are being developed for the ever more detailed quantification of gene expression, providing an insight into the function of the newly discovered genes, while molecular genetic tools provide a link between these genes and heritable traits. Genetic tests are now available to determine the likelihood of suffering specific ailments and can predict how plant cultivars may respond to the environment. The steps in the translation of the genetic blueprint to the observed phenotype is being increasingly understood through proteome, metabolome and genome analysis, all underpinned by advances in bioinformatics. Bioinformatics is becoming increasingly central to the study of biology and a day at a computer can often save a year or more in the laboratory. The volume is intended for graduate level biology students as well as researchers who wish to gain a better understanding of applied bioinformatics and who wish to use bioinformatics technologies to assist in their research. The volume would also be of value to bioinformatics developers, particularly those from a computing background who would like to understand the application of computational tools for biological research.
