Bornberg-Bauer ,Mamoru Kato,2024-06-28 Cancer is characterized by heterogeneous cells with capacity for self renewal and
selective pressures in the microenvironment which constantly change the cell population This descent with modification is
consistent with Darwin s definition of evolution and accordingly cancer progression can be captured from an evolutionary
angle However there is also a clear difference between cancer progression and biological evolution First contrary to the
evolution of complex organisms cancer originates from cells of multicellular organisms that escape their constraints and
behave like unicellular organisms Therefore from the beginning cancer cells have complex genomes that contain abundant
genetic materials which they can use to change their phenotype by dynamic rearrangements and modifications Secondly
epigenetic effects promote cancer evolution in contrast to the evolution of life Some tumors develop with minimal genetic
alterations and cell plasticity contributes to both initiation and progression in various tumors However an evolutionary theory
that encompasses these characteristics of cancer remains to be developed **Subject Guide to Books in Print** ,2001
