**Advances in Applied Biotechnology** Marian Petre, 2012-01-20 Biotechnology is the scientific field of studying and applying the most efficient methods and techniques to get useful end products for the human society by using viable micro organisms cells and tissues of plants or animals or even certain functional components of their organisms that are grown in fully controlled conditions to maximize their specific metabolism inside fully automatic bioreactors It is very important to make the specific difference between biotechnology as a distinct science of getting valuable products from molecules cells or tissues of viable organisms and any other applications of bioprocesses that are based on using the whole living plants or animals in different fields of human activities such as bioremediation environmental protection organic agriculture or industrial exploitation of natural resources The volume **Advances in Applied Biotechnology** is a scientific book containing recent advances of selected research works that are ongoing in certain biotechnological applications Fourteen chapters divided in four sections related to the newest biotechnological achievements in environmental protection medicine and health care biopharmaceutical producing molecular genetics and tissue engineering are presented

**High Value Fermentation Products, Volume 1** Saurabh Saran, Vikash Babu, Asha Chaubey, 2019-04-09 Green technologies are no longer the future of science but the present With more and more mature industries such as the process industries making large strides seemingly every single day and more consumers demanding products created from green technologies it is essential for any business in any industry to be familiar with the latest processes and technologies It is all part of a global effort to go greener and this is nowhere more apparent than in fermentation technology This book describes relevant aspects of industrial scale fermentation an expanding area of activity which already generates commercial values of over one third of a trillion US dollars annually and which will most likely radically change the way we produce chemicals in the long term future From biofuels and bulk amino acids to monoclonal antibodies and stem cells they all rely on mass suspension cultivation of cells in stirred bioreactors which is the most widely used and versatile way to produce Today a wide array of cells can be cultivated in this way and for most of them genetic engineering tools are also available Examples of products operating procedures engineering and design aspects economic drivers and cost and regulatory issues are addressed In addition there will be a discussion of how we got to where we are today and of the real world in industrial fermentation This chapter is exclusively dedicated to large scale production used in industrial settings

**Biogas Production** Ackmez Mudhoo, 2012-05-01 Biogas Production covers the most cutting edge pretreatment processes being used and studied today for the production of biogas As an increasingly important piece of the energy pie biogas and other biofuels are being

used more and more around the world in every conceivable area of industry and could be a partial answer to the energy problem and the elimination of global warming This book will highlight the recent advances in the pretreatment and value addition of lignocellulosic wastes LCW with the main focus on domestic and agro industrial residues Mechanical physical and biological treatment systems are brought into perspective The main value added products from lignocellulosic wastes are summarized in a manner that pinpoints the most recent trends and the future directions Physico chemical and biological treatment systems seem to be the most favored options while biofuels biodegradable composites and biosorbents production paint a bright picture of the current and future bio based products Engineered microbes seem to tackle the problem of bioconversion of substrates that are otherwise nonconvertible by conventional wild strains Although the main challenge facing LCW utilization is the high costs involved in treatment and production processes some recent affordable processes with promising results have been proposed Future trends are being directed to nanobiotechnology and genetic engineering for improved processes and products *Medical and Health Care Books and Serials in Print* ,1997
