*Abstract*—Automatic license plate recognition (LPR) plays an important role in numerous applications and a number of techniques have been proposed. However, most of them worked under restricted conditions, such as fixed illumination, limited vehicle speed, designated routes, and stationary backgrounds. In this study, as few constraints as possible on the working environment are considered. The proposed LPR technique consists of two main modules: a license plate locating module and a license number identification module. The former characterized by fuzzy disciplines attempts to extract license plates from an input image, while the latter conceptualized in terms of neural subjects aims to identify the number present in a license plate. Experiments have been conducted for the respective modules. In the experiment on locating license plates, 1088 images taken from various scenes and under different conditions were employed. Of which, 23 images have been failed to locate the license plates present in the images; the license plate location rate of success is 97.9%. In the experiment on identifying license number, 1065 images, from which license plates have been successfully located, were used. Of which, 47 images have been failed to identify the numbers of the license plates located in the images; the identification rate of success is 95.6%. Combining the above two rates, the overall rate of success for our LPR algorithm is 93.7%.

*Index Terms*—Color edge detector, fuzzification, license number identification, license plate locating, license plate recognition (LPR), self-organizing (SO) character recognition, spring model, topological sorting, two-stage fuzzy aggregation.

## I. INTRODUCTION

AUTOMATIC license plate recognition (LPR) plays an important role in numerous applications such as unattended parking lots [31], [35], security control of restricted areas [8], traffic law enforcement [7], [33], congestion pricing [5], and automatic toll collection [20]. Due to different working environments, LPR techniques vary from application to application. Most previous works have in some way restricted their working conditions [9], such as limiting them to indoor scenes, stationary backgrounds [30], fixed illumination [7], prescribed driveways [22], [26], limited vehicle speeds [1], or designated ranges of the distance between camera and vehicle [23]. The aim of this study is to lessen many of these restrictions.

Of the various working conditions, outdoor scenes and non-stationary backgrounds may be the two factors that most influ-

ence the quality of scene images acquired and in turn the complexity of the techniques needed. In an outdoor environment, illumination not only changes slowly as daytime progresses, but may change rapidly due to changing weather conditions and passing objects (e.g., cars, airplanes, clouds, and overpasses). In addition, pointable cameras create dynamic scenes when they move, pan or zoom. A dynamic scene image may contain multiple license plates or no license plate at all. Moreover, when they do appear in an image, license plates may have arbitrary sizes, orientations and positions. And, if complex backgrounds are involved, detecting license plates can become quite a challenge.

Typically, an LPR process consists of two main stages: 1) locating license plates and 2) identifying license numbers. In the first stage, license plate candidates are determined based on the features of license plates. Features commonly employed have been derived from the license plate format and the alphanumeric characters constituting license numbers. The features regarding license plate format include shape, symmetry [15], height-to-width ratio [23], [25], color [17], [25], texture of grayness [2], [25], spatial frequency [26], and variance of intensity values [8], [10]. Character features include line [34], blob [13], the sign transition of gradient magnitudes, the aspect ratio of characters [12], the distribution of intervals between characters [28], and the alignment of characters [32]. In reality, a small set of robust, reliable, and easy-to-detect object features would be adequate.

The license plate candidates determined in the locating stage are examined in the license number identification stage. There are two major tasks involved in the identification stage, character separation and character recognition. Character separation has in the past been accomplished by such techniques as projection [11], [30], morphology [2], [10], [28] relaxation labeling, connected components [25], and blob coloring. Every technique has its own advantages and disadvantages. Since the projection method assumes the orientation of a license plate is known and the morphology method requires knowing the sizes of characters, these two approaches are not appropriate for our application because of their required assumptions. Relaxation labeling is by nature iterative and often time consuming. In this study, a hybrid of connected components and blob coloring techniques is considered for character separation.

There have been a large number of character recognition techniques reported. They include genetic algorithms [17], artificial neural networks [2], [16], [26], fuzzy *c*-means [25], support vector machine [16], Markov processes [6], and finite automata [1]. These methods can be broadly classified into iterative and noniterative approaches. There is a tradeoff between these two groups of approaches; iterative methods achieve better accuracy, but at the cost of increased time complexity. In this study, we pay more attention to accuracy than time complexity whenever
