Advanced Photon Counting Peter Kapusta, Michael Wahl, Rainer Erdmann, 2015-04-23 This volume focuses on Time Correlated Single Photon Counting TCSPC a powerful tool allowing luminescence lifetime measurements to be made with high temporal resolution even on single molecules Combining spectrum and lifetime provides a fingerprint for identifying such molecules in the presence of a background Used together with confocal detection this permits single molecule spectroscopy and microscopy in addition to ensemble measurements opening up an enormous range of hot life science applications such as fluorescence lifetime imaging FLIM and measurement of F rster Resonant Energy Transfer FRET for the investigation of protein folding and interaction Several technology related chapters present both the basics and current state of the art in particular of TCSPC electronics photon detectors and lasers The remaining chapters cover a broad range of applications and methodologies for experiments and data analysis including the life sciences defect centers in diamonds super resolution microscopy and optical tomography The chapters detailing new options arising from the combination of classic TCSPC and fluorescence lifetime with methods based on intensity fluctuation represent a particularly unique highlight

Modern Tools for Time-Resolved Luminescence Biosensing and Imaging ,2021-09-01 Imaging from Cells to Animals

In Vivo Margarida Barroso, Xavier Intes, 2020-12-03 Imaging from Cells to Animals In Vivo offers an overview of optical imaging techniques developed over the past two decades to investigate biological processes in live cells and tissues It comprehensively covers the main imaging approaches used as well as the application of those techniques to biological investigations in preclinical models Among the areas covered are cell metabolism receptor ligand interactions membrane trafficking cell signaling cell migration cell adhesion cytoskeleton and other processes using various molecular optical imaging techniques in living organisms such as mice and zebrafish Features Brings together biology and advanced optical imaging techniques to provide an overview of progress and modern methods from microscopy to whole body imaging Fills the need for a comprehensive view of application driven development and use of new tools to ask new biological questions in the context of a living system Includes basic chapters on key methods and instrumentation from fluorescence microscopy and imaging to endoscopy optical coherence tomography and super resolution imaging Discusses approaches at different length scales and biomedical applications to the study of single cell whole organ and whole organism behavior Addresses the impact on discovery such as cellular function as implicated in human disease and translational medicine for example in cancer diagnosis

Introduction to Experimental Biophysics Jay L. Nadeau, 2017-10-10 Praise for the First Edition essential reading for any physical scientist who is interested in performing biological research Contemporary Physics an ambitious text Each chapter contains protocols and the conceptual reasoning behind them which is often useful to physicists performing biological experiments for the first time Physics Today This fully updated and expanded text is the best starting point for any student or researcher in the physical sciences to gain firm grounding in the techniques employed in molecular biophysics and

quantitative biology It includes brand new chapters on gene expression techniques advanced techniques in biological light microscopy super resolution two photon and fluorescence lifetime imaging holography and gold nanoparticles used in medicine The author shares invaluable practical tips and insider s knowledge to simplify potentially confusing techniques The reader is guided through easy to follow examples carried out from start to finish with practical tips and insider s knowledge The emphasis is on building comfort with getting hands wet with basic methods and finally understanding when and how to apply or adapt them to address different questions Jay L Nadeau is a scientific researcher and head of the Biomedical Engineering in Advanced Applications of Quantum Oscillatory and Nanotechnological Systems BEAAQONS lab at Caltech and was previously associate professor of biomedical engineering and physics at McGill University

Time-Correlated Single Photon Counting Applications Wolfgang Becker,2015-04-13 This book is an attempt to bridge the gap between the instrumental principles of multi dimensional time correlated single photon counting TCSPC and typical applications of the technique Written by an originator of the technique and by sucessful users it covers the basic principles of the technique its interaction with optical imaging methods and its application to a wide range of experimental tasks in life sciences and clinical research The book is recommended for all users of time resolved detection techniques in biology bio chemistry spectroscopy of live systems live cell microscopy clinical imaging spectroscopy of single molecules and other applications that require the detection of low level light signals at single photon sensitivity and picosecond time resolution

Advanced Time-Correlated Single Photon Counting Techniques Wolfgang Becker,2005-12-19 In 1984 Desmond O Connor and David Phillips published their comprehensive book Time correlated Single Photon Counting At that time time correlated single photon counting or TCSPC was used primarily to record fluorescence decay functions of dye solutions in cuvettes From the beginning TCSPC was an amazingly sensitive and accurate technique with excellent time resolution However acquisition times were relatively slow due to the low repetition rate of the light sources and the limited speed of the electronics of the 70s and early 80s Moreover TCSPC was intrinsically one dimensional i e limited to the recording of the wa form of a periodic light signal Even with these limitations it was a wonderful technique More than 20 years have elapsed and electronics and laser techniques have made impressive progress The number of transistors on a single chip has approximately doubled every 18 months resulting in a more than 1 000 fold increase in complexity and speed The repetition rate and power of pulsed light sources have increased by about the same factor
