

Transport in Plants

The phloem transports dissolved sugars to the rest of the plant from the leaves.

The xylem transports water and minerals up the plant from roots to leaves.

Water moves from the roots to the leaves, up the xylem via the **TRANSPIRATION STREAM**.

Plants also have a large surface area (provided by root hair cells) so they absorb most of the water and minerals a plant will need.

Waxy cuticle - water and gas proof
Stops too much water loss.

Water is lost more quickly when it's windy or dry or hot.

Water loss from the leaves is called **TRANSPIRATION**.

Leaves are thin and flat giving them a large surface area for diffusion of gases (CO_2 in and oxygen out).
Guard cells around stomata can open and close to let CO_2 in but stop too much water being lost!

Artificial breathing

Positive pressure - pushing the air in.

Benefits: Not invasive (just a mask), can aid the paralysed for years and can be used during surgery.
Can be used at home!

Negative pressure - a vacuum is created outside the body moving the chest up and causing air to be drawn in.

The Iron Lung

Benefits: Will keep you alive.
Drawbacks: Very restricting and out dated. Must stay in hospital (not really used anymore).

Sustainable Food
'producing food in a way that can continue for many years'

Using a fermenter

Lungs

Trachea (windpipe)

Biology Unit 3

Adaptations for gaseous exchange (in your lungs)

- Large surface area
- Short diffusion pathway (only one cell between blood and air in lungs)
- Steep concentration gradient. Remember: a substance will move from where there's a lot to where there's a little. This is helped with **good blood supply** and **breathing** (so lots of oxygen keeps entering CO_2 in lungs. The oxygen then gets in to absorbed and releases CO_2)

Alveoli - Air sacs in the Lungs! you have loads of these wrapped in capillaries.

Active Transport

This is when some thing moves against the concentration gradient.
Low to High!

It needs energy to happen!
But means ions can be absorbed from soil and sugars and salts can move into cells.

Water moved up a plant stem from cell to cell by osmosis. Lots of water keeps the cell turgid.

Water moves in and out of cell depending on the concentration of the solution surrounding them.

Large surface area
- Short diffusion pathway (only one cell between blood and air in lungs)
- Good blood supply (so lots of oxygen gets in to absorbed and releases CO_2 from the capillaries to the blood)

Adaptations for exchange in the intestines (absorbing your food)

Energy Drinks - For when your **DEHYDRATED**.
Contain: Water, sugar and mineral ions.
Water - to rehydrate
Sugar - for energy
Minerals - to replace those lost during sweating.

Osmosis

WATER diffusing from where it is a lot of it to where there is less of it.

Through a partially permeable membrane.

Remember: A concentrated substance usually contains less water.
