Carmen STANICA¹, Petru MOLDOVAN²

Prezența ineluaților nemetaleice solide în aliajele de aluminiu poate provoca reducerea valoarelor proprietăților mecanice ale produselor termice, creșterea porosității gazelor, a prelașării și a porosității la suprafața fluidului și a calității slabă a suprafeței.

Tehnicii pentru determinarea ineluaților pot fi: metalografie convențională, analiză chimică, teste volumetrice, tehnici mecanico-structurale și altele.

Scopul lucrării este să studieze ineluații poroziți rezultați din aliaj de aluminiu 5083 prin tehnica PoDFA.

Datele obținute prin analiză arată că probele din aliaj 5083 sunt puțin conținute de ineluații care se situează între 0.011 mm²/kg și 0.025 mm²/kg, principalele ineluații fiind TiB₂, Al₂C₆, Al₂O₃, MgO, spinel și material refractor.

The presence of solid non-metallic inclusions in aluminum alloys can cause reduction in mechanical properties of castings, increased gas porosity, poor machinability, decrease in fluidity and poor surface quality.

Techniques for inclusions assessment can be: quantitative metallography, chemical analysis, volumetric tests, mechanico-structural techniques and so on.

The focus of this paper is to study the assessment of melt cleanliness in 5083 aluminum alloy using PoDFA technique.

Analysing data reflect the cleanliness of 5083 alloy actually sampled. The inclusions content was between 0.011 mm²/kg and 0.025 mm²/kg, the main inclusions being TiB₂, Al₂C₆, Al₂O₃, MgO, spinel and refractory material.

Keywords: aluminum, cleanliness, PoDFA, inclusions

1. Introduction

Aluminum alloys are characterized by their low specific weight, low melting point, negligible gas solubility with the exception of hydrogen, excellent castability, good machinability, and good corrosion resistance. Premium quality castings are an essential requisite for the critical structural components used in automotive and aeronautics. The production of such castings requires that inclusions and porosity be minimized (or even eliminated) to surpass their

Landefeld,1988-06 For a number of years it has been a General Motors Research Laboratories custom to hold a symposium on a subject which is new and emerging and to invite the best people in the world in that subject to come together to talk to each other Initially I had some difficulty in regarding foundry processes as a new and emerging subject Copper alloys have been in foundry practice for about six thousand years Foundrymen working with those alloys have been recognized as such for nearly all that time Iron has a much shorter history probably only three or four thousand years So what s new What is new is that a subject which has always been so complex and so difficult that it could only be a craft skill with bits and pieces of knowledge and bits and pieces of insight has begun to yield to new abilities to solve very complex problems We do this now because we can handle

great amounts of data by computational means using new and more complicated theoretical treatments than we could deal with before In fact we have a new technology with which we can attack these terribly difficult problems Thus foundry processing is becoming a new subject because new things can be done with it **Light Metals 1997** Christian Bickert, R.
