### Fishes of the Amazon and Their Environment

A.L. Val, V.M.F. de Almeida-Val, 2012-12-06 The Amazon is a giant piece of amphibian land which is the result of complex geological and evolutionary processes The number of living beings in such a land is difficult to estimate The interactions between these organisms and the environment are fascinating but barely understood These features lured us to the Amazon in 1981 However soon after we realized that the dimensions of these interactions were overwhelming This book is designed to review aspects of the physiology and biochemistry of fishes of the Amazon The description of the pulsative nature of the environment and the distinct features of the ichthyofauna of the Amazon were central to the main goal Nevertheless any complete view is limited by the magnitude of the intraspecific variability coupled with the complex fluctuations of the environment Thus we have placed an emphasis on respiratory physiology and biochemistry The reference list was made as complete as possible particularly regarding special publications not readily available We hope that this book is useful for comparative physiologists tropical biologists and the people interested in interactions between organisms and their environment We are grateful to many people who contributed to the making of this book Our initial ideas were

**Microbial Role in the Carbon Cycle in Tropical Inland Aquatic Ecosystems** André Megali Amado,Fábio Roland,2017-03-15 Aquatic microorganisms are tidily related to the carbon cycle in aquatic systems especially in respect to its accumulation and emission to atmosphere In one hand the autotrophs are responsible for the carbon input to the ecosystems and trophic chain On the other hand the heterotrophs traditionally play a role in the carbon mineralization and since microbial loop theory may play a role to carbon flow through the organisms However it is not yet clear how the heterotrophs contribute to carbon retention and emission especially from tropical aquatic ecosystems Most of the studies evaluating the role of microbes to carbon cycle in inland waters were performed in high latitudes and only a few studies in the tropical area In the prospective of global changes where the warm tropical lakes and rivers become even warmer it is important to understand how microorganisms behave and interact with carbon cycle in the Earth region with highest temperature and light availability This research topic documented microbial responses to natural latitudinal gradients spatial within and between ecosystems gradients temporal approaches and temperature and nutrient manipulations in the water and in the sediment     *Study and Interpretation of the Chemical Characteristics of Natural Water* John David Hem,1985 Deze derde herziene uitgave op het gebied van de chemische karakteristieken van natuurlijk water grond en oppervlaktewater is uitgegaan van hetzelfde basis organisatiemodel en dient dezelfde algemene doelstellingen als voorgaande uitgaven
