*Solution of  $f(A)x = b$  with Krylov  
subspace information*

---

### 11.1 Introduction

In this chapter, I expand on an idea for exploiting Krylov subspace information obtained for the matrix  $A$  and the vector  $b$ . This subspace information can be used for the approximate solution of a linear system  $f(A)x = b$ , where  $f$  is some analytic function,  $A \in \mathbb{R}^{n \times n}$ , and  $b \in \mathbb{R}^n$ . I will make suggestions on how to use this for the case where  $f$  is the matrix *sign* function. The matrix *sign* function plays an important role in QCD computations, see for instance [147].

In [197] an approach was suggested for the use of a Krylov subspace for the computation of approximate solutions of linear systems

$$f(A)x = b.$$

The approach was motivated by the function  $f(A) = A^2$ , which plays a role in the solution of some biharmonic systems. The approach is easily generalized for nonsymmetric complex matrices, but we may have to pay more attention to the evaluation of  $f$  for the reduced system, associated with the Krylov subspace.

In particular, I will discuss some possible approaches in which the Krylov subspace is used for the computation of  $\text{sign}(A)p$  for given vectors  $p$ . With the evaluation of the matrix *sign* function we have to be extremely careful. A popular approach, based on a Newton iteration, converges fast, but is sensitive for rounding errors, especially when  $A$  is ill-conditioned. We will briefly discuss a computational method that was suggested (and analysed) by Bai and Demmel [15]. This approach can also be combined, in principle, with the subspace reduction technique.

## **Iterative Krylov Methods For Large Linear Systems:**

**Iterative Krylov Methods for Large Linear Systems** H. A. van der Vorst, 2003-04-17 Computational simulation of scientific phenomena and engineering problems often depends on solving linear systems with a large number of unknowns. This book gives insight into the construction of iterative methods for the solution of such systems and helps the reader to select the best solver for a given class of problems. The emphasis is on the main ideas and how they have led to efficient solvers such as CG, GMRES and BI-CGSTAB. The author also explains the main concepts behind the construction of preconditioners. The reader is encouraged to gain experience by analysing numerous examples that illustrate how best to exploit the methods. The book also hints at many open problems and as such it will appeal to established researchers. There are many exercises that motivate the material and help students to understand the essential steps in the analysis and construction of algorithms.

**Krylov Methods for Nonsymmetric Linear Systems** Gérard Meurant, Jurjen Duintjer Tebbens, 2020-10-02 This book aims to give an encyclopedic overview of the state of the art of Krylov subspace iterative methods for solving nonsymmetric systems of algebraic linear equations and to study their mathematical properties. Solving systems of algebraic linear equations is among the most frequent problems in scientific computing; it is used in many disciplines such as physics, engineering, chemistry, biology and several others. Krylov methods have progressively emerged as the iterative methods with the highest efficiency while being very robust for solving large linear systems; they may be expected to remain so independent of progress in modern computer-related fields such as parallel and high performance computing. The mathematical properties of the methods are described and analyzed along with their behavior in finite precision arithmetic. A number of numerical examples demonstrate the properties and the behavior of the described methods. Also considered are the methods' implementations and coding as Matlab-like functions. Methods which became popular recently are considered in the general framework of Q-OR, quasi-orthogonal, Q-MR, quasi-minimum residual methods. This book can be useful for both practitioners and for readers who are more interested in theory. Together with a review of the state of the art, it presents a number of recent theoretical results of the authors, some of them unpublished, as well as a few original algorithms. Some of the derived formulas might be useful for the design of possible new methods or for future analysis. For the more applied user, the book gives an up-to-date overview of the majority of the available Krylov methods for nonsymmetric linear systems, including well-known convergence properties and, as we said above, template codes that can serve as the base for more individualized and elaborate implementations.

the numerical accuracy in a variety of problems      *Parallel Computing is Everywhere* Sanzio Bassini, Gerhard R. Joubert, Frans Peters, 2018-03-15 The most powerful computers work by harnessing the combined computational power of millions of processors and exploiting the full potential of such large scale systems is something which becomes more difficult with each succeeding generation of parallel computers Alternative architectures and computer paradigms are increasingly being investigated in an attempt to address these difficulties Added to this the pervasive presence of heterogeneous and parallel devices in consumer products such as mobile phones tablets personal computers and servers also demands efficient programming environments and applications aimed at small scale parallel systems as opposed to large scale supercomputers This book presents a selection of papers presented at the conference Parallel Computing ParCo2017 held in Bologna Italy on 12 to 15 September 2017 The conference included contributions about alternative approaches to achieving High Performance Computing HPC to potentially surpass exa and zetascale performances as well as papers on the application of quantum computers and FPGA processors These developments are aimed at making available systems better capable of solving intensive computational scientific engineering problems such as climate models security applications and classic NP problems some of which cannot currently be managed by even the most powerful supercomputers available New areas of application such as robotics AI and learning systems data science the Internet of Things IoT and in car systems and autonomous vehicles were also covered As always ParCo2017 attracted a large number of notable contributions covering present and future developments in parallel computing and the book will be of interest to all those working in the field      A Survey of Preconditioned Iterative Methods Are Magnus Bruaset, 2018-12-13 The problem of solving large sparse linear systems of algebraic equations is vital in scientific computing even for applications originating from quite different fields A Survey of Preconditioned Iterative Methods presents an up to date overview of iterative methods for numerical solution of such systems Typically the methods considered are w      *SIAM Journal on Scientific Computing* ,2009      **Iterative Methods and Preconditioning for Large and Sparse Linear Systems with Applications** Daniele Bertaccini, Fabio Durastante, 2018-02-19 This book describes in a basic way the most useful and effective iterative solvers and appropriate preconditioning techniques for some of the most important classes of large and sparse linear systems The solution of large and sparse linear systems is the most time consuming part for most of the scientific computing simulations Indeed mathematical models become more and more accurate by including a greater volume of data but this requires the solution of larger and harder algebraic systems In recent years research has focused on the efficient solution of large sparse and or structured systems generated by the discretization of numerical models by using iterative solvers      **Krylov Subspace Methods with Fixed Memory Requirements** Kirk McLane Soodhalter, 2012 Krylov subspace iterative methods provide an effective tool for reducing the solution of large linear systems to a size for which a direct solver may be applied However the problems of limited storage and speed are still a concern Therefore in this dissertation work we present iterative Krylov

subspace algorithms for non Hermitian systems which do have fixed memory requirements and have favorable convergence characteristics This dissertation describes three projects The first project concerns short term recurrence Krylov subspace methods for nearly Hermitian linear systems In 2008 Beckermann and Reichel introduced a short term recurrence progressive GMRES algorithm for nearly Hermitian linear systems However we have found this method to be unstable We document the instabilities and introduce a different fixed memory algorithm to treat nearly Hermitian problems We present numerical experiments demonstrating that the performance of this algorithm is competitive The other two projects involve extending a strategy called Krylov subspace recycling introduced by Parks and colleagues in 2005 This method requires more overhead than other subspace augmentation methods but offers the ability to recycle subspace information between cycles for a single linear system and recycle information between related linear systems In the first project we extend subspace recycling to the block Krylov subspace setting A block Krylov subspace is a generalization of Krylov subspace where a single starting vector is replaced with a block of linearly independent starting vectors We then apply our method to a sequence of matrices arising in a Newton iteration applied to fluid density functional theory and present some numerical experiments In the second project we extend the methods of subspace recycling to a family of linear systems differing only by multiples of the identity These problems arise in the theory of quantum chromodynamics a theory of the behavior of subatomic particles We wish to build on the class of Krylov methods which allow the simultaneous solution of all shifted linear systems while generating only one subspace However the mechanics of subspace recycling complicates this situation and interferes with our ability to simultaneously solve all systems using these techniques Therefore we introduce an algorithm which avoids this complication and present some numerical experiments demonstrating its effectiveness
