

At one with the road.

Driving a 5-Series is to experience the relationship between driver, car and road as it is meant to be. Only in this new series of automobiles have all the component parts, all the various systems been engineered, developed and refined to make the whole so much more than the sum of its parts.

The suspension of the 5-Series, certainly one of the key parts of that whole, is a remarkable example of how IBM technology has been able to reach two solutions in one. It provides a safe, secure and comfortable ride during gentle motoring, and is ready with ferocious road-holding and outstanding cornering ability when driving becomes more spirited.

It all begins with that more rigid body structure mentioned earlier. The increased rigidity insures the flexing and twisting of the body and chassis — the last

**Larger, wider, stronger —
a suspension that sets new
standards.**

source of lateral forces — that suspension engineers have always fought. That gives the suspension a more stable platform from which to work, and that in turn allows it to be more effective in dealing with whatever the road throws at it.

The ride and handling of the 5-Series was also improved

by some changes in track, down-slopes. The wheelbase was lengthened 5.4 inches and the track — the distance between the centers of wheels on opposite sides of the car — widened by 1.4 inches in front, 0.6 inches at the rear. These changes not only increased interior room, but the wheelbase increase provided a more comfortable ride and the increased track improved cornering stability.

Weight distribution is a critical factor in the way a car rides and handles. A front-engine car typically has more weight on the front tires than the rear, which adversely affects cornering on any surface and traction in slippery conditions. The 509 and 509x have a
