

# MIG Welding (GMAW) Process

MIG welding is a gas shielded metal arc welding process using the heat of an electric arc between a continuously fed, consumable electrode wire and the material to be welded.

A wire of copper coated mild steel is fed continuously from a reel through a gun with a melting rate up to 5m/min.

Current through the wire ranges from 100 to 400 A depending upon the diameter of the wire.

CO<sub>2</sub> is principally used apart from argon or argon-helium mixture as shielding gas.

human intervention It does not seem that the traditional robotic welding techniques by themselves can cope well with uncertainties in the welding surroundings and conditions e.g. variation of weld pool dynamics, fluxion, solid weld torch and etc. On the other hand, the advent of intelligent techniques provides us with a powerful tool for solving demanding real world problems with uncertain and unpredictable environments. Therefore, it is interesting to gather current trends and to provide a high quality forum for engineers and researchers working in the field of intelligent techniques for robotic welding systems. This volume brings together a broad range of invited and contributed papers that describe recent progress in this field.
