Advanced Log Linear Models Using Sas:

Advanced Log-linear Models Using SAS Daniel Zelterman,2002 Describes applications of log linear models that use GENMOD procedure in SAS to solve problems the arise in the statistical analysis of categorical data   Adaptive Regression for Modeling Nonlinear Relationships George J. Knafl,Kai Ding,2016-09-20 This book presents methods for investigating whether relationships are linear or nonlinear and for adaptively fitting appropriate models when they are nonlinear Data analysts will learn how to incorporate nonlinearity in one or more predictor variables into regression models for different types of outcome variables Such nonlinear dependence is often not considered in applied research yet nonlinear relationships are common and so need to be addressed A standard linear analysis can produce misleading conclusions while a nonlinear analysis can provide novel insights into data not otherwise possible A variety of examples of the benefits of modeling nonlinear relationships are presented throughout the book Methods are covered using what are called fractional polynomials based on real valued power transformations of primary predictor variables combined with model selection based on likelihood cross validation The book covers how to formulate and conduct such adaptive fractional polynomial modeling in the standard logistic and Poisson regression contexts with continuous discrete and counts outcomes respectively either univariate or multivariate The book also provides a comparison of adaptive modeling to generalized additive modeling GAM and multiple adaptive regression splines MARS for univariate outcomes The authors have created customized SAS macros for use in conducting adaptive regression modeling These macros and code for conducting the analyses discussed in the book are available through the first author s website and online via the book s Springer website Detailed descriptions of how to use these macros and interpret their output appear throughout the book These methods can be implemented using other programs   **Computer-Aided Multivariate Analysis, Fourth Edition** Abdelmonem Afifi,Susanne May,Virginia A. Clark,2003-12-29 Computer Aided Multivariate Analysis Fourth Edition enables researchers and students with limited mathematical backgrounds to understand the concepts underlying multivariate statistical analysis perform analysis using statistical packages and understand the output New topics include Loess and Poisson regression nominal and ordinal logistic regression interpretation of interactions in logistic and survival analysis and imputation for missing values This book includes new exercises and references and updated options in the latest versions of the statistical packages All data sets and codebooks are available for download The authors explain the assumptions made in performing each analysis and test how to determine if your data meets those assumptions and what to do if they do not What to Watch out for sections in each chapter warn of common difficulties By reading this text you will know what method to use with your data set how to get the results and how to interpret them and explain them to others New in the Fourth Edition Expanded explanation of checking for goodness of fit in logistic regression and survival analysis Kaplan Meier estimates of survival curves formal tests for comparing survival between groups interactions and the use of time dependent covariates in survival analysis Expanded
