Algorithm Design: A Methodological Approach - 150 problems and detailed solutions Patrick Bosc,Marc Guyomard,Laurent Miclet,2023-01-31 A bestseller in its French edition this book is original in its construction and its success in the French market demonstrates its appeal It is based on three principles 1 An organization of the chapters by families of algorithms exhaustive search divide and conquer etc On the contrary there is no chapter devoted only to a systematic exposure of say algorithms on strings Some of these will be found in different chapters 2 For each family of algorithms an introduction is given to the mathematical principles and the issues of a rigorous design with one or two pedagogical examples 3 For the most part the book details 150 problems spanning seven families of algorithms For each problem a precise and progressive statement is given More importantly a complete solution is detailed with respect to the design principles that have been presented often some classical errors are pointed out Roughly speaking two thirds of the book is devoted to the detailed rational construction of the solutions

Guide to Competitive Programming Antti Laaksonen, 2020-05-08 Building on what already is the most comprehensive introduction to competitive programming, this enhanced new textbook features new material on advanced topics such as calculating Fourier transforms, finding minimum cost flows in graphs, and using automata in string problems. Critically, the text accessibly describes and shows how competitive programming is a proven method of implementing and testing algorithms as well as developing computational thinking and improving both programming and debugging skills. Topics and features introduce dynamic programming and other fundamental algorithm design techniques and investigate a wide selection of graph algorithms compatible with the IOI Syllabus yet also covering more advanced topics such as maximum flows, Nim theory, and suffix structures. Surveys specialized algorithms for trees and discusses the mathematical topics that are relevant in competitive programming. Reviews the features of the C programming language and describes how to create efficient algorithms that can quickly process large data sets. Discusses sorting algorithms and binary search and examines a selection of data structures of the C standard library. Covers such advanced algorithm design topics as bit parallelism and amortized analysis and presents a focus on efficiently processing array range queries. Describes a selection of more advanced topics including square root algorithms and dynamic programming optimization. Fully updated, expanded, and easy to follow, this core textbook guide is an ideal reference for all students needing to learn algorithms and to practice for programming contests. Knowledge of programming basics is assumed but previous background in algorithm design or programming contests is not necessary. With its breadth of topics, examples, and references, the book is eminently suitable for both beginners and more experienced readers alike.
