Short Course, Modeling and Simulation of Biological Networks,2007-08-21 It is the task of computational biology to help elucidate the unique characteristics of biological systems This process has barely begun and many researchers are testing computational tools that have been used successfully in other fields Mathematical and statistical network modeling is an important step toward uncovering the organizational principles and dynamic behavior of biological networks Undoubtedly new mathematical tools will be needed however to meet this challenge The workhorse of this effort at present comprises the standard tools from applied mathematics which have proven to be successful for many problems But new areas of mathematics not traditionally considered applicable are contributing other powerful tools This volume is intended to introduce this topic to a broad mathematical audience The aim is to explain some of the biology and the computational and mathematical challenges we are facing The different chapters provide examples of how these challenges are met with particular emphasis on nontraditional mathematical approaches The volume features a broad spectrum of networks across scales ranging from biochemical networks within a single cell to epidemiological networks encompassing whole cities Chapter topics include phylogenetics and gene finding using tools from statistics and algebraic geometry biochemical network inference using tools from computational algebra control theoretic approaches to drug delivery using differential equations and interaction based modeling and discrete mathematics applied to problems in population dynamics and epidemiology   **Biology International** ,2001   **Realistic Simulation of Time-course Measurements in Systems**

Biology Janine Egert,Clemens Kreutz,2023 Abstract In systems biology the analysis of complex nonlinear systems faces many methodological challenges For the evaluation and comparison of the performances of novel and competing computational methods one major bottleneck is the availability of realistic test problems We present an approach for performing realistic simulation studies for analyses of time course data as they are typically measured in systems biology Since the design of experiments in practice depends on the process of interest our approach considers the size and the dynamics of the mathematical model which is intended to be used for the simulation study To this end we used 19 published systems biology models with experimental data and evaluated the relationship between model features e g the size and the dynamics and features of the measurements such as the number and type of observed quantities the number and the selection of measurement times and the magnitude of measurement errors Based on these typical relationships our novel approach enables suggestions of realistic simulation study designs in the systems biology context and the realistic generation of simulated data for any dynamic model The approach is demonstrated on three models in detail and its performance is validated on nine models by comparing ODE integration parameter optimization and parameter identifiability The presented approach enables more realistic and less biased benchmark studies and thereby constitutes an important tool for the development of novel methods for dynamic modeling **Systems Biology** Olaf Wolkenhauer,P. E. Wellstead,Kwang-Hyun Cho,2008 Contains topics including modelling the dynamics of signalling pathways modelling metabolic networks using power laws and S systems modelling reaction kinetics in cells the regulatory design of cellular processes metabolomics and fluxomics modelling cellular signalling systems and systems analysis of MAPK signal transduction **Dynamic Modeling** Bruce Hannon,Matthias Ruth,2013-04-19 The book uses STELLA software to develop simulation models thus allowing readers to convert their understanding of a phenomenon to a computer model and then run it to yield the inevitable dynamic consequences built into the structure Part I provides an introduction to modeling dynamic systems while Part II offers general modeling methods Parts III through VIII then apply these methods to model real world phenomena from chemistry genetics ecology economics and engineering A clear approachable introduction to the modeling process of interest in any field where real problems can be illuminated by computer simulation *Methodik Der Information in Der Medizin* ,1992 **Measurements, Modelling and Simulation of Dynamic Systems** Edward Layer,Krzysztof Tomczyk,2009-12-30 The development and use of models of various objects is becoming a more common practice in recent days This is due to the ease with which models can be developed and examined through the use of computers and appropriate software Of those two the former high speed computers are easily accessible nowadays and the latter existing programs are being updated almost continuously and at the same time new powerful software is being developed Usually a model represents correlations between some processes and their interactions with better or worse quality of representation It details and characterizes a part of the real world taking into account a structure of phenomena as well as quantitative and qualitative relations There are

a great variety of models Modelling is carried out in many diverse fields All types of natural phenomena in the area of biology ecology and medicine are possible subjects for modelling Models stand for and represent technical objects in physics chemistry engineering social events and behaviours in sociology financial matters investments and stock markets in economy strategy and tactics defence security and safety in military fields There is one common point for all models We expect them to fulfil the validity of prediction It means that through the analysis of models it is possible to predict phenomena which may occur in a fragment of the real world represented by a given model We also expect to be able to predict future reactions to signals from the outside world   *Discrete Event Modeling and Analysis for Systems Biology Models* Hayssam Soueidan,2009 A general goal of systems biology is to acquire a detailed understanding of the dynamics of living systems by relating functional properties of whole systems with the interactions of their constituents Often this goal is tackled through computer simulation A number of different formalisms are currently used to construct numerical representations of biological systems and a certain wealth of models is proposed using ad hoc methods There arises an interesting question of to what extent these models can be reused and composed together or in a larger framework In this thesis we propose BioRica as a means to circumvent the difficulty of incorporating disparate approaches in the same modeling study BioRica is an extension of the AltaRica specification language to describe hierarchical non deterministic General Semi Markov processes We first extend the syntax and automata semantics of AltaRica in order to account for stochastic labeling We then provide a semantics to BioRica programs in terms of stochastic transition systems that are transition systems with stochastic labeling We then develop numerical methods to symbolically compute the probability of a given finite path in a stochastic transition systems We then define algorithms and rules to compile a BioRica system into a stand alone C simulator that simulates the underlying stochastic process We also present language extensions that enables the modeler to include into a BioRica hierarchical systems nodes that use numerical libraries e g Mathematica Matlab GSL Such nodes can be used to perform numerical integration or flux balance analysis during discrete event simulation We then consider the problem of using models with uncertain parameter values Quantitative models in Systems Biology depend on a large number of free parameters whose values completely determine behavior of models Some range of parameter values produce similar system dynamics making it possible to define general trends for trajectories of the system e g oscillating behavior for some parameter values In this work we defined an automata based formalism to describe the qualitative behavior of systems dynamics Qualitative behaviors are represented by finite transition systems whose states contain predicate valuation and whose transitions are labeled by probabilistic delays We provide algorithms to automatically build such automata representation by using random sampling over the parameter space and algorithms to compare and cluster the resulting qualitative transition system Finally we validate our approach by studying a rejuvenation effect in yeasts cells population by using a hierarchical population model defined in BioRica Models of ageing for yeast cells aim to provide insight into the

general biological processes of ageing For this study we used the BioRica framework to generate a hierarchical simulation tool that allows dynamic creation of entities during simulation The predictions of our hierarchical mathematical model has been validated experimentally by the micro biology laboratory of Gothenburg <u>IEE Proceedings</u> ,2006
