[An Engineer's Guide to Automated Testing of High-speed Interfaces](#) José Moreira,Hubert Werkmann,2010 Providing a complete introduction to the state of the art in high speed digital testing with automated test equipment ATE this practical resource is the first book focus exclusively on this increasingly important topic Featuring clear examples this one stop reference covers all critical aspects of the subject from high speed digital basics ATE instrumentation for digital applications and test and measurements to production testing support instrumentation and test fixture design This in depth volume also discusses at advanced ATE topics such as multiplexing of ATE pin channels and testing of high speed bi directional interfaces with fly by approaches

[Signal Integrity Validation for High-speed Serial Links](#) Alex Messan,2005 [Post-Silicon Validation and Debug](#) Prabhat Mishra,Farimah Farahmandi,2018-09-01 This book provides a comprehensive coverage of System on Chip SoC post silicon validation and debug challenges and state of the art solutions with contributions from SoC designers academic researchers as well as SoC verification experts The readers will get a clear understanding of the existing debug infrastructure and how they can be effectively utilized to verify and debug SoCs

**Cost Effective Tests for High Speed I/O Subsystems** Ji Hwan Chun,2011 The growing demand for high performance systems in modern computing technology drives the development of advanced and high speed designs in I O structures Due to their data rate and architecture however testing of the high speed serial interfaces becomes more

expensive when using conventional test methods In order to alleviate the test cost issue a loopback test scheme has been widely adopted To assess the margin of the signal eye in the loopback configuration the eye margin is purposely reduced by additional devices on the loopback path or using design for testability DFT features such as timing and voltage margining Although the loopback test scheme successfully reduces the test cost by decoupling the dependency of external test equipment it has robustness issues such as a fault masking issue and a non ideality problem of margining circuits The focus of this dissertation is to propose new methods to resolve the known issues in the loopback test mode The fault masking issue in a loopback pair of analog to digital and digital to analog converters ADC and DAC which can be found in pulse amplitude modulation PAM signaling schemes is resolved using a proposed algorithm which separates the characteristics of the ADC and the DAC from a combined loopback response The non ideality problem of margining circuit is resolved using a proposed method which utilizes a random jitter injection technique Using the injected random jitter the jitter distribution is sampled by undersampling and margining which provides the nonlinearity information using the proposed algorithm Since the proposed method requires a random jitter source on the load board an alternative solution is proposed which uses an intrinsic jitter profile and a sliding window search algorithm to characterize the nonlinearities The sliding search algorithm was implemented in a low cost high volume manufacturing HVM tester to assess feasibility and validity of the proposed technique The proposed methods are compatible with the existing loopback test scheme and require a minimal area and design overhead hence they provide cost effective ways to enhance the robustness of the loopback test scheme
