

## SECTION 1

## Working with Isotherms and Temperature Maps

Both the pattern and variety of temperature on Earth are outputs of the global energy system. Temperature maps portray the interaction of the principal temperature controls: latitude, altitude, cloud cover, and land-water heating differences. To depict the spatial aspect of data, geographers utilize *isopleths* (also called *isolines*)—lines drawn on a map connecting points of equal value, such as contour lines on a topographic map that show points of equal elevation (Lab Exercise 23).

An isopleth on temperature maps is known as an **isotherm** (similarly, pressure maps = isobars, precipitation maps = isohyets, and equal-wind

velocity = isotachs). An isotherm connects points of equal temperature and presents the pattern of temperature for analysis. Geographers are concerned with the spatial distribution of temperatures, and isotherms facilitate this analysis.

In Lab Exercise 23, Section 2, you will construct contour lines to show elevation change. Isotherms, connecting equal temperature values, are drawn in much the same way. Construct the appropriate isotherms at 5°C intervals on the weather map in **Figure 9.1**. The surface weather map data were recorded at 7:00 A.M. EST on October 30, 1993.

*by mean of an area is affected by ocean currents.*

1. The 0°C (32°F) isotherm is already drawn for you (highlight it to make it distinctive). You may find it helpful to use colored pencils to "group" the temperature intervals (5°C intervals, above and below 0°C). Use a pencil to lightly sketch the isotherms, then use a pen to darken the lines, which should be smooth curved lines. (See your geography text or the weather page of the newspaper for examples of isothermal maps.) Begin with the 5°C isotherm, then draw the 10°C and 15°C isotherms. Continue by completing the +5°C, +10°C, +15°C, +20°C, and finally, +25°C isotherms.
