**Algorithms and Complexity**, 1976      State-Space Search Weixiong Zhang, 2012-12-06 This book is about problem solving Specifically it is about heuristic state space search under branch and

bound framework for solving combinatorial optimization problems. The two central themes of this book are the average case complexity of heuristic state space search algorithms based on branch and bound and their applications to developing new problem solving methods and algorithms. Heuristic state space search is one of the fundamental problem solving techniques in Computer Science and Operations Research and usually constitutes an important component of most intelligent problem solving systems. The search algorithms considered in this book can be classified into the category of branch and bound. Branch and bound is a general problem solving paradigm and is one of the best techniques for optimally solving computation intensive problems such as scheduling and planning. The main search algorithms considered include best first search, depth first branch and bound, iterative deepening, recursive best first search and space bounded best first search. Best first search and depth first branch and bound are very well known and have been used extensively in Computer Science and Operations Research. One important feature of depth first branch and bound is that it only requires space that is linear in the maximal search depth, making it very often a favorable search algorithm over best first search in practice. Iterative deepening and recursive best first search are the other two linear space search algorithms. Iterative deepening is an important algorithm in Artificial Intelligence and plays an irreplaceable role in building a real time game playing program.

**Approximation and Optimization** Ioannis C. Demetriou, Panos M. Pardalos, 2019-05-10. This book focuses on the development of approximation related algorithms and their relevant applications. Individual contributions are written by leading experts and reflect emerging directions and connections in data approximation and optimization. Chapters discuss state of the art topics with highly relevant applications throughout science, engineering, technology and social sciences. Academics, researchers, data science practitioners, business analysts, social sciences investigators and graduate students will find the number of illustrations, applications and examples provided useful. This volume is based on the conference Approximation and Optimization Algorithms Complexity and Applications which was held in the National and Kapodistrian University of Athens, Greece, June 29-30, 2017. The mix of survey and research content includes topics in approximations to discrete, noisy data, binary sequences, design of networks and energy systems, fuzzy control, large scale optimization, noisy data, data dependent approximation, networked control systems, machine learning, optimal design, no free lunch theorem, non linearly constrained optimization, spectroscopy.
