

Remote Interface Configuration

This section gives information on configuring the remote interface. For additional information, see chapter 4, "Remote Interface Reference," starting on page 103.

GPIB Address

Each device on the GPIB (IEEE-488) interface must have a unique address. You can set the multimeter's address to any value between 0 and 31. The address is set to "22" when the multimeter is shipped from the factory. The GPIB address is displayed at power-on.

3

The GPIB address can be set only from the front-panel.

- The address is stored in non-volatile memory, and does not change when power has been off or after a remote interface reset.
- You can set the address to "31" which is the talk only mode. In this mode, the multimeter can output readings directly to a printer without being addressed by a bus controller (over either GPIB or RS-232). For proper operation, make sure your printer is configured in the listen always mode. Address 31 is not a valid address if you are operating the multimeter from the GPIB interface with a bus controller.

If you select the RS-232 interface and then set the GPIB address to the talk only address (31), the multimeter will send readings over the RS-232 interface when in the local mode.

- If you select the RS-232 interface and then set the GPIB address to the talk only address (31), the multimeter will send readings over the RS-232 interface when in the local mode.
- Your GPIB bus controller has its own address. Be sure to avoid using the bus controller's address for any instrument on the interface bus. Agilent controllers generally use address "21".
