effects Overall the final lap for 100 m events and the middle two laps for 200 m and 400 m events had the strongest relationship $r = 0.709$ with final time A change in these laps was associated with 0.408% improvement in final time for finalists and 0.511% for semifinalists depending on sex stroke and event However a similar pattern of lap times was adopted in each event regardless of the sex finish position or the best and worst swims for an individual To gain a competitive advantage many athletes employ some form of altitude training in an attempt to elicit small enhancements in performance
