Programming Languages and Systems ,2005 **Programming Language Concepts** Peter Sestoft,2017-08-31 This book uses a functional programming language F as a metalanguage to present all concepts and examples and thus has an operational flavour enabling practical experiments and exercises It includes basic concepts such as abstract syntax interpretation stack machines compilation type checking garbage collection and real machine code Also included are more advanced topics on polymorphic types type inference using unification co and contravariant types continuations and backwards code generation with on the fly peephole optimization This second edition includes two new chapters One describes compilation and type checking of a full functional language tying together the previous chapters The other describes how to compile a C subset to real x86 hardware as a smooth extension of the previously presented compilers The examples present several interpreters

and compilers for toy languages including compilers for a small but usable subset of C abstract machines a garbage collector and ML style polymorphic type inference Each chapter has exercises Programming Language Concepts covers practical construction of lexers and parsers but not regular expressions automata and grammars which are well covered already It discusses the design and technology of Java and C to strengthen students understanding of these widely used languages

Mathematical Reviews ,2006 *Monadic and Substructural Type Systems for Region-based Memory Management*

Matthew Thomas Fluet,2007 Region based memory management is a scheme for managing dynamically allocated data A defining characteristic of region based memory management is the bulk deallocation of data which avoids both the tedium of malloc free and the overheads of a garbage collector Type systems for region based memory management enhance the utility of this scheme by statically determining when a program is guaranteed to not perform any erroneous region operations We describe three type systems for region based memory management a type and effect system a la the Tofte Talpin region calculus a novel monadic type system a novel substructural type system We demonstrate how to successively encode the type and effect system into the monadic type system and the monadic type system into the substructural type system These type systems and encodings support the argument that the type and effect systems that have traditionally been used to ensure the safety of regionbased memory management are neither the simplest nor the most expressive type systems for this purpose The monadic type system generalizes the state monad of Launchbury and Peyton Jones and demonstrates that the well understood parametric polymorphism of System F provides sufficient encapsulation to ensure the safety of region based memory management The essence of the first encoding is to translate effects to an indexed monad trading the subtleties of a type and effect system for the simplicity of a monadic type system However both the type and effect system and the monadic type system require that regions have nested lifetimes following the lexical scope of the program restricting when data may be effectively reclaimed Hence we introduce a substructural type system that eliminates the nested lifetimes requirement The key idea is to introduce first class capabilities that mediate access to a region and to provide separate primitives for creating and destroying regions The essence of the second encoding is to break open the monad to reveal its store passing implementation Finally we show that the substructural type system is expressive enough to faithfully encode other advanced memory management features Abstract
