Abstract: Major advances that improve control in the process industry have been made over the last ten years in the basic PID technology of modern distributed control systems. This paper addresses the impact that international standards have on control implementation and the tools utilized in industry for monitoring and commissioning PID control. Examples are used to illustrate how new technologies, such as model switching for process identification, have allowed manufacturers to introduce a new level of ease-of-use in tools developed for on-demand and adaptive tuning. This paper discusses PID modifications that improve the speed of recovery from process saturation conditions that are common in industrial applications. Also, details are provided on PID modifications that enable effective control with non-periodic measurement updates by wireless transmitters. Finally, prospective future directions for industrial PID controllers are sketched.

Keywords: Process Saturation, Wireless Transmitters, Control, PID, Monitoring, IEC61804, Fieldbus, Function Block

1. INTRODUCTION

Within the process industry the PID remains the dominant technique for feedback control. Thus, there is continued interest by the academic community and control system manufacturers in PID modifications that may improve control performance and in tools that make it easier to commission control and monitor its performance. Much of the basic PID research published in the literature focuses on control performance for unconstrained operation of linear and stationary processes. In contrast, work within the process control industry focuses on increasing utilization of single loop and multi-loop control based on PID taking into account process non-linearity and operating constraints.

The IEC61804 standard for function blocks in the process industry and the Fieldbus Foundation function block specification define the structure and parameters that are used in PID control. Adoption of these standards allows process control manufacturers to provide a consistent means of implementing process control in controllers and field devices. Having a consistent representation of the PID and consistency in block parameter names and structures makes it easier for manufacturers to provide tools for PID control. A new generation of performance monitoring tools allows a process or control engineer or an instrumentation technician to easily identify any issues in control loop performance.

Technology for on-demand loop tuning is available in most control systems. The challenge is to structure the user interface in a manner that allows a control loop to be tuned with little or no knowledge of process control. To minimize the user involvement with control, adaptive tuning based on model switching is available in commercial control systems.

Within the process industry, various techniques have traditionally been used to speed the response of the PID recovery from a process saturation condition. New work in this area demonstrates how the PID may be modified to speed recovery from process saturation. Such enhancements benefit process saturation applications such as compressor anti-surge control.

The recent introduction of wireless transmitters and wireless actuators in the process industry has sparked new interest in PID modifications that allow effective control using non-periodic information updates. The underlying assumption in process control has always been that control is executed on a periodic basis and that a new measurement value is available each execution. However, to minimize power consumption a wireless transmitter may transmit a new measurement infrequently and only if the measurement has changed a significant amount. Thus, to effectively utilize a wireless measurement such as that provided by WirelessHART transmitters, it is necessary to modify the PID to work with non-periodic measurement updates. Details on how the PID has been modified in a commercial control system are intended to demonstrate how non-periodic measurement updates can be used in control.

The paper is structured as follows – section 2 outlines the state of process automation, section 3 discusses performance monitoring tools, section 4 and 5 addresses on-demand and adaptive tuning, section 6 presents PID design for process saturation, section 7 demonstrates PID modifications for wireless control and finally section 8 provides conclusions and some thoughts on future PID direction.
