Behavioral Synthesis Programming Computational Intelligence:

Behavioral Program Synthesis with Genetic Programming Krzysztof Krawiec, 2015-12-15 Genetic programming GP is a popular heuristic methodology of program synthesis with origins in evolutionary computation In this generate and test approach candidate programs are iteratively produced and evaluated The latter involves running programs on tests where they exhibit complex behaviors reflected in changes of variables registers or memory That behavior not only ultimately determines program output but may also reveal its hidden qualities and important characteristics of the considered synthesis problem However the conventional GP is oblivious to most of that information and usually cares only about the number of tests passed by a program This evaluation bottleneck leaves search algorithm underinformed about the actual and potential qualities of candidate programs This book proposes behavioral program synthesis a conceptual framework that opens GP to detailed information on program behavior in order to make program synthesis more efficient Several existing and novel mechanisms subscribing to that perspective to varying extent are presented and discussed including implicit fitness sharing semantic GP co solvability trace convergence analysis pattern guided program synthesis and behavioral archives of subprograms The framework involves several concepts that are new to GP including execution record combined trace and search driver a generalization of objective function Empirical evidence gathered in several presented experiments clearly demonstrates the usefulness of behavioral approach The book contains also an extensive discussion of implications of the behavioral perspective for program synthesis and beyond

Genetic Programming Theory and Practice XIII Rick Riolo, W.P. Worzel, Mark Kotanchek, Arthur Kordon, 2016-12-20 These contributions written by the foremost international researchers and practitioners of Genetic Programming GP explore the synergy between theoretical and empirical results on real world problems producing a comprehensive view of the state of the art in GP Topics in this volume include multi objective genetic programming learning heuristics Kaizen programming Evolution of Everything EvE lexibase selection behavioral program synthesis symbolic regression with noisy training data graph databases and multidimensional clustering It also covers several chapters on best practices and lesson learned from hands on experience Additional application areas include financial operations genetic analysis and predicting product choice Readers will discover large scale real world applications of GP to a variety of problem domains via in depth presentations of the latest and most significant results

Chakrabarti, S. C. DeSarkar, 2013-11-11 A large number of problems require the optimization of multiple criteria. These criteria are often non commensurate and sometimes conflicting in nature making the task of optimization more difficult. In such problems the task of creating a combined optimization function is often not easy. Moreover the decision procedure can be affected by the sensitivity of the solution space and the trade off is often non linear. In real life we traditionally handle such problems by suggesting not one but several non dominated solutions. Finding a set of non dominated solutions is also useful in multistaged optimization problems where the solution of one stage of optimization is passed on to the next stage. One classic example is that of circuit design where high level synthesis, logic synthesis and layout synthesis comprise important stages of optimization of the circuit. Passing a set of non dominated partial solutions from one stage to the next typically ensures better global optimization. This book presents a new approach to multi criteria optimization based on heuristic search techniques. Classical multicriteria optimization techniques rely on single criteria optimization algorithms and hence we are either required to optimize one criterion at a time under constraints on the others or we are asked for a single scalar combined optimization function. On the other hand the multiobjective search approach maps each optimization criterion onto a distinct dimension of a vector valued cost structure.

Neuroscience: From Neural Networks to Artificial Intelligence
Pablo Rudomin, 1993-06-25 The Central Nervous System can be considered as an aggregate of neurons specialized in both the transmission and transformation of information. Information here has been used for many purposes but the most important one is probably to generate a representation of the external world that allows the organism to react properly to changes in its external environment. These functions range from such basic ones as detection of changes that may lead to tissue damage and eventual destruction of the organism and the implementation of avoidance reactions to more elaborate representations of the external world implying recognition of shapes, sounds and textures as the basis of planned action or even reflection. The question is how can we hope to understand the complexity inherent in this range of functionalities. One of the distinguishing features of the last two decades has been the availability of computational power that has impacted the many areas of science concerned with this question. An effort has been made within this book to cross boundaries and to have active scientists from different backgrounds and disciplines explain the basic principles which guide their investigations with the hope that this will lay the basis for a future collaborative effort to understand the principles of neural networks.
