BLS for Healthcare Providers Critical Concepts

High-quality CPR improves a victim's chances of survival. The critical characteristics of high-quality CPR include:

- Start compressions within 10 seconds of recognition of cardiac arrest. It is important to compress to the appropriate depth to create blood flow. Compressions are important because they pump blood to the rest of the body.
- Push hard, push fast: Compress at a rate of at least 100/min with a depth of at least 2 inches (5cm) for adults, approximately 2 inches (5cm) for children, and approximately 1 1/4 or 1.5 inches (4cm) for infants.
- Allow complete chest recoil after each compression. Complete chest recoil contributes to effective CPR by allowing the heart to refill with blood between compressions.
- Minimize interruptions in compressions (try to limit interruptions to < 10 seconds).
- Give effective breaths that make the chest rise.
- Avoid excessive ventilation.

Automated External Defibrillator-AED

- As soon as an AED becomes available, the first step the rescuer should perform is to turn on the AED.
- After the AED delivers a shock, the rescuer should immediately restart CPR, beginning with chest compressions.
- Using an AED for a child less than 8 years of age, adult pads/dose may be used if pediatric pads/dose attenuator are not available.
