

11.2 Cladogram for Tetrapods

Diagram presents hypothesized evolutionary relationships among a group of species based on shared ancestry and derived characters.

CLASH

A *clade* is a group of organisms that share certain traits, derived from a common ancestor. In this cladogram, a clade looks like the letter "V," including all the branches that extend from the right end of the "V." The diagnostic clade includes birds, reptiles, mammals, amphibians, and alligators, and birds.

1997

In a cladogram, a node is the intersection of two branches. This node represents the most recent common ancestor shared by the entire tetrapoda clade.

DERIVED CHARACTER

Organisms that branch off after a hash mark share the derived character represented by the hash mark. An embryo protected by amniotic fluid is a derived character shared by all organisms in the amniota clade. Amphibians do not have this derived character.

THE
FUTURE

Which groups of animals belong to the amniota clade? Which belong to the archosauria clade?
