Bringing together the world's leading researchers and practitioners of computational mechanics these new volumes meet and build on the eight key challenges for research and development in computational mechanics. Researchers have recently identified eight critical research tasks facing the field of computational mechanics. These tasks have come about because it appears possible to reach a new level of mathematical modelling and numerical solution that will lead to a much deeper understanding of nature and to great improvements in engineering design. The eight tasks are: The automatic solution of mathematical models; Effective numerical schemes for fluid flows; The development of an effective mesh free numerical solution method; The development of numerical procedures for multiphysics problems; The development of numerical procedures for multiscale problems; The modelling of uncertainties; The analysis of complete life cycles of systems; Education teaching sound engineering and scientific judgement. Readers of Computational Fluid and Solid Mechanics 2003 will be able to apply the combined experience of many of the world's leading researchers to their own research needs. Those in academic environments will gain a better insight into the needs and constraints of the industries they are involved with; those in industry will gain a competitive advantage by gaining insight into the cutting edge research being carried out by colleagues in academia. Features: Bridges the gap between academic researchers and practitioners in industry; Outlines the eight main challenges facing Research and Design in Computational mechanics and offers new insights into the shifting the research agenda; Provides a vision of how strong basic and exciting education at university can be harmonized with life long learning to obtain maximum value from the new powerful tools of analysis.

Sheet Metal Forming Processes Dorel Banabic, 2010-06-21. The concept of virtual manufacturing has been developed in order to increase the industrial performances being one of the most efficient ways of reducing the manufacturing times and improving the quality of the products. Numerical simulation of metal forming processes as a component of the virtual manufacturing process has a very important contribution to the reduction of the lead time. The finite element method is currently the most widely used numerical procedure for simulating sheet metal forming processes. The accuracy of the simulation programs used in industry is influenced by the constitutive models and the forming limit curves models incorporated in their structure. From the above discussion we can distinguish a very strong connection between virtual manufacturing as a general concept finite element method as a numerical analysis instrument and constitutive laws as well as forming limit curves as a specificity of the sheet metal forming processes. Consequently the material modeling is strategic when models of reality have to be built. The book gives a synthetic presentation of the research performed in the field of sheet metal forming simulation during more than 20 years by the members of three international teams: the Research Centre on Sheet Metal Forming CERTETA Technical University of Cluj-Napoca Romania; AutoForm Company from Zurich Switzerland and VOLVO automotive company from Sweden. The first chapter

presents an overview of different Finite Element FE formu tions used for sheet metal forming simulation now and in the past
